

# Course Wrap-Up

---

**Computer Graphics**  
**CMU 15-462/15-662**

# Where is graphics headed?

- **Extremely diverse field**
  - **Anything related to synthesis of perceptual phenomena**
  - **Images, sound, physical objects, ...**
- **Some very "hot" topics right now:**
  - **Virtual Reality / Augmented Reality (VR/AR)**
  - **3D Fabrication (e.g., 3D printing)**
  - **Computational Photography**

# Virtual reality (VR) vs augmented reality (AR)

## VR = virtual reality

User is completely immersed in virtual world (sees only light emitted by display)

## AR = augmented reality

Display is an overlay that augments user's normal view of the real world (e.g., terminator)

# VR headsets

Oculus Rift (Crescent Bay Prototype)

Sony Morpheus

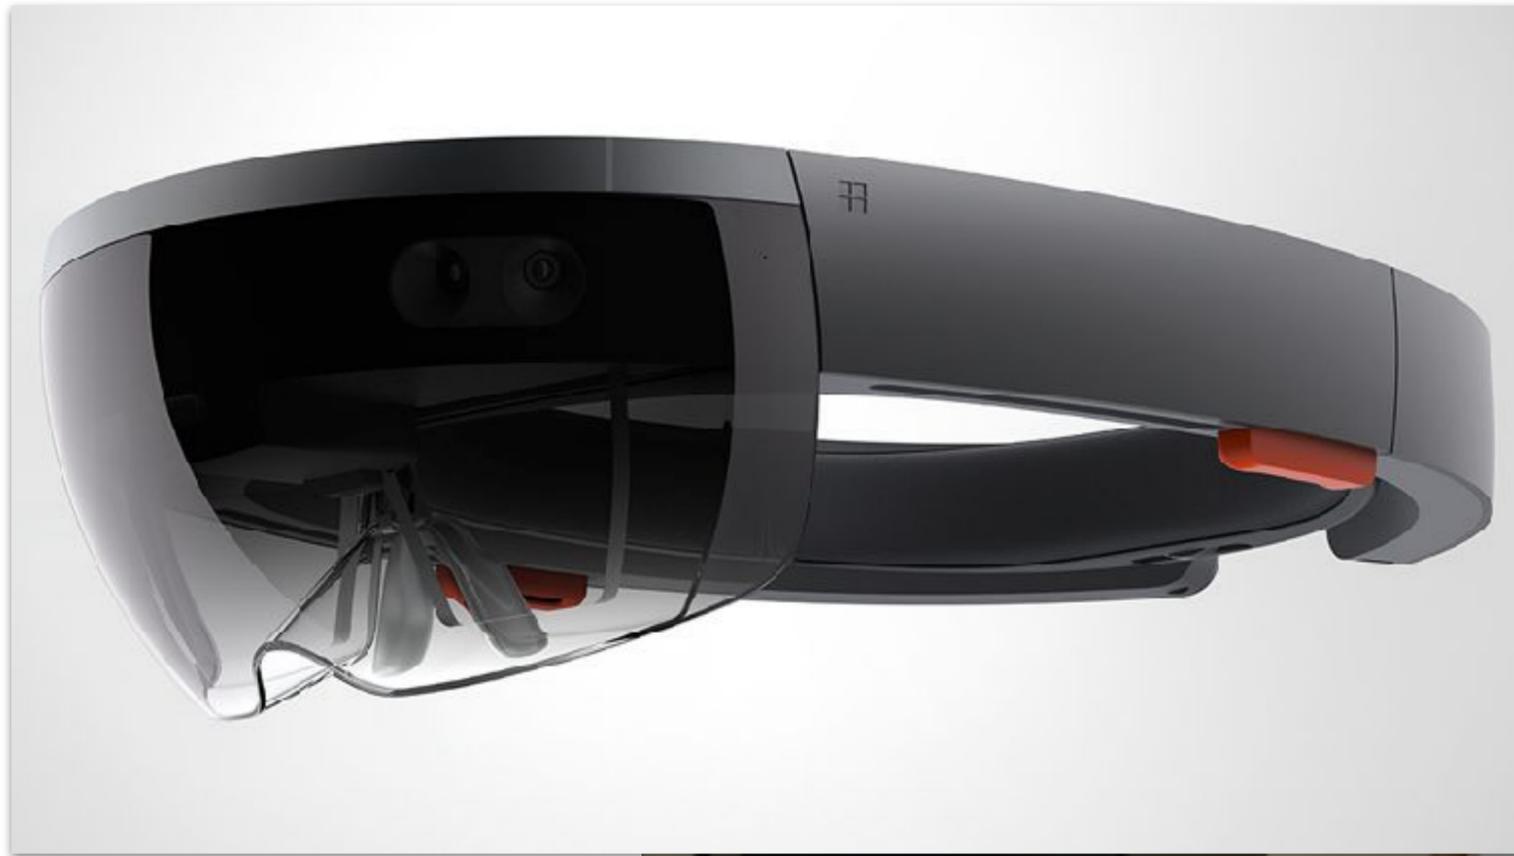

HTC Vive

Google Cardboard

# AR headset: Microsoft HoloLens

# Today: rendering challenges of VR

- **Since you are now all experts in rendering, you can appreciate some of the unique challenges of rendering in the context of modern VR headsets**
- **VR also presents many other difficult technical challenges**
  - **display technologies**
  - **accurate tracking of face, head, and body position**
  - **haptics (simulation of touch)**
  - **sound synthesis**
  - **user interface challenges (inability of user to walk around environment, how to manipulate objects in virtual world)**
  - **content creation challenges**
  - **and on and on...**

# VR gaming

**Bullet Train Demo (Epic)**

# VR video

Vaunt VR (Paul McCartney concert)

# VR teleconference / video chat

# Oculus Rift DK2

**Rift DK2 is best documented of modern headsets, so I'll use it for discussion here**

**Oculus Rift DK2**

# Oculus Rift DK2 headset

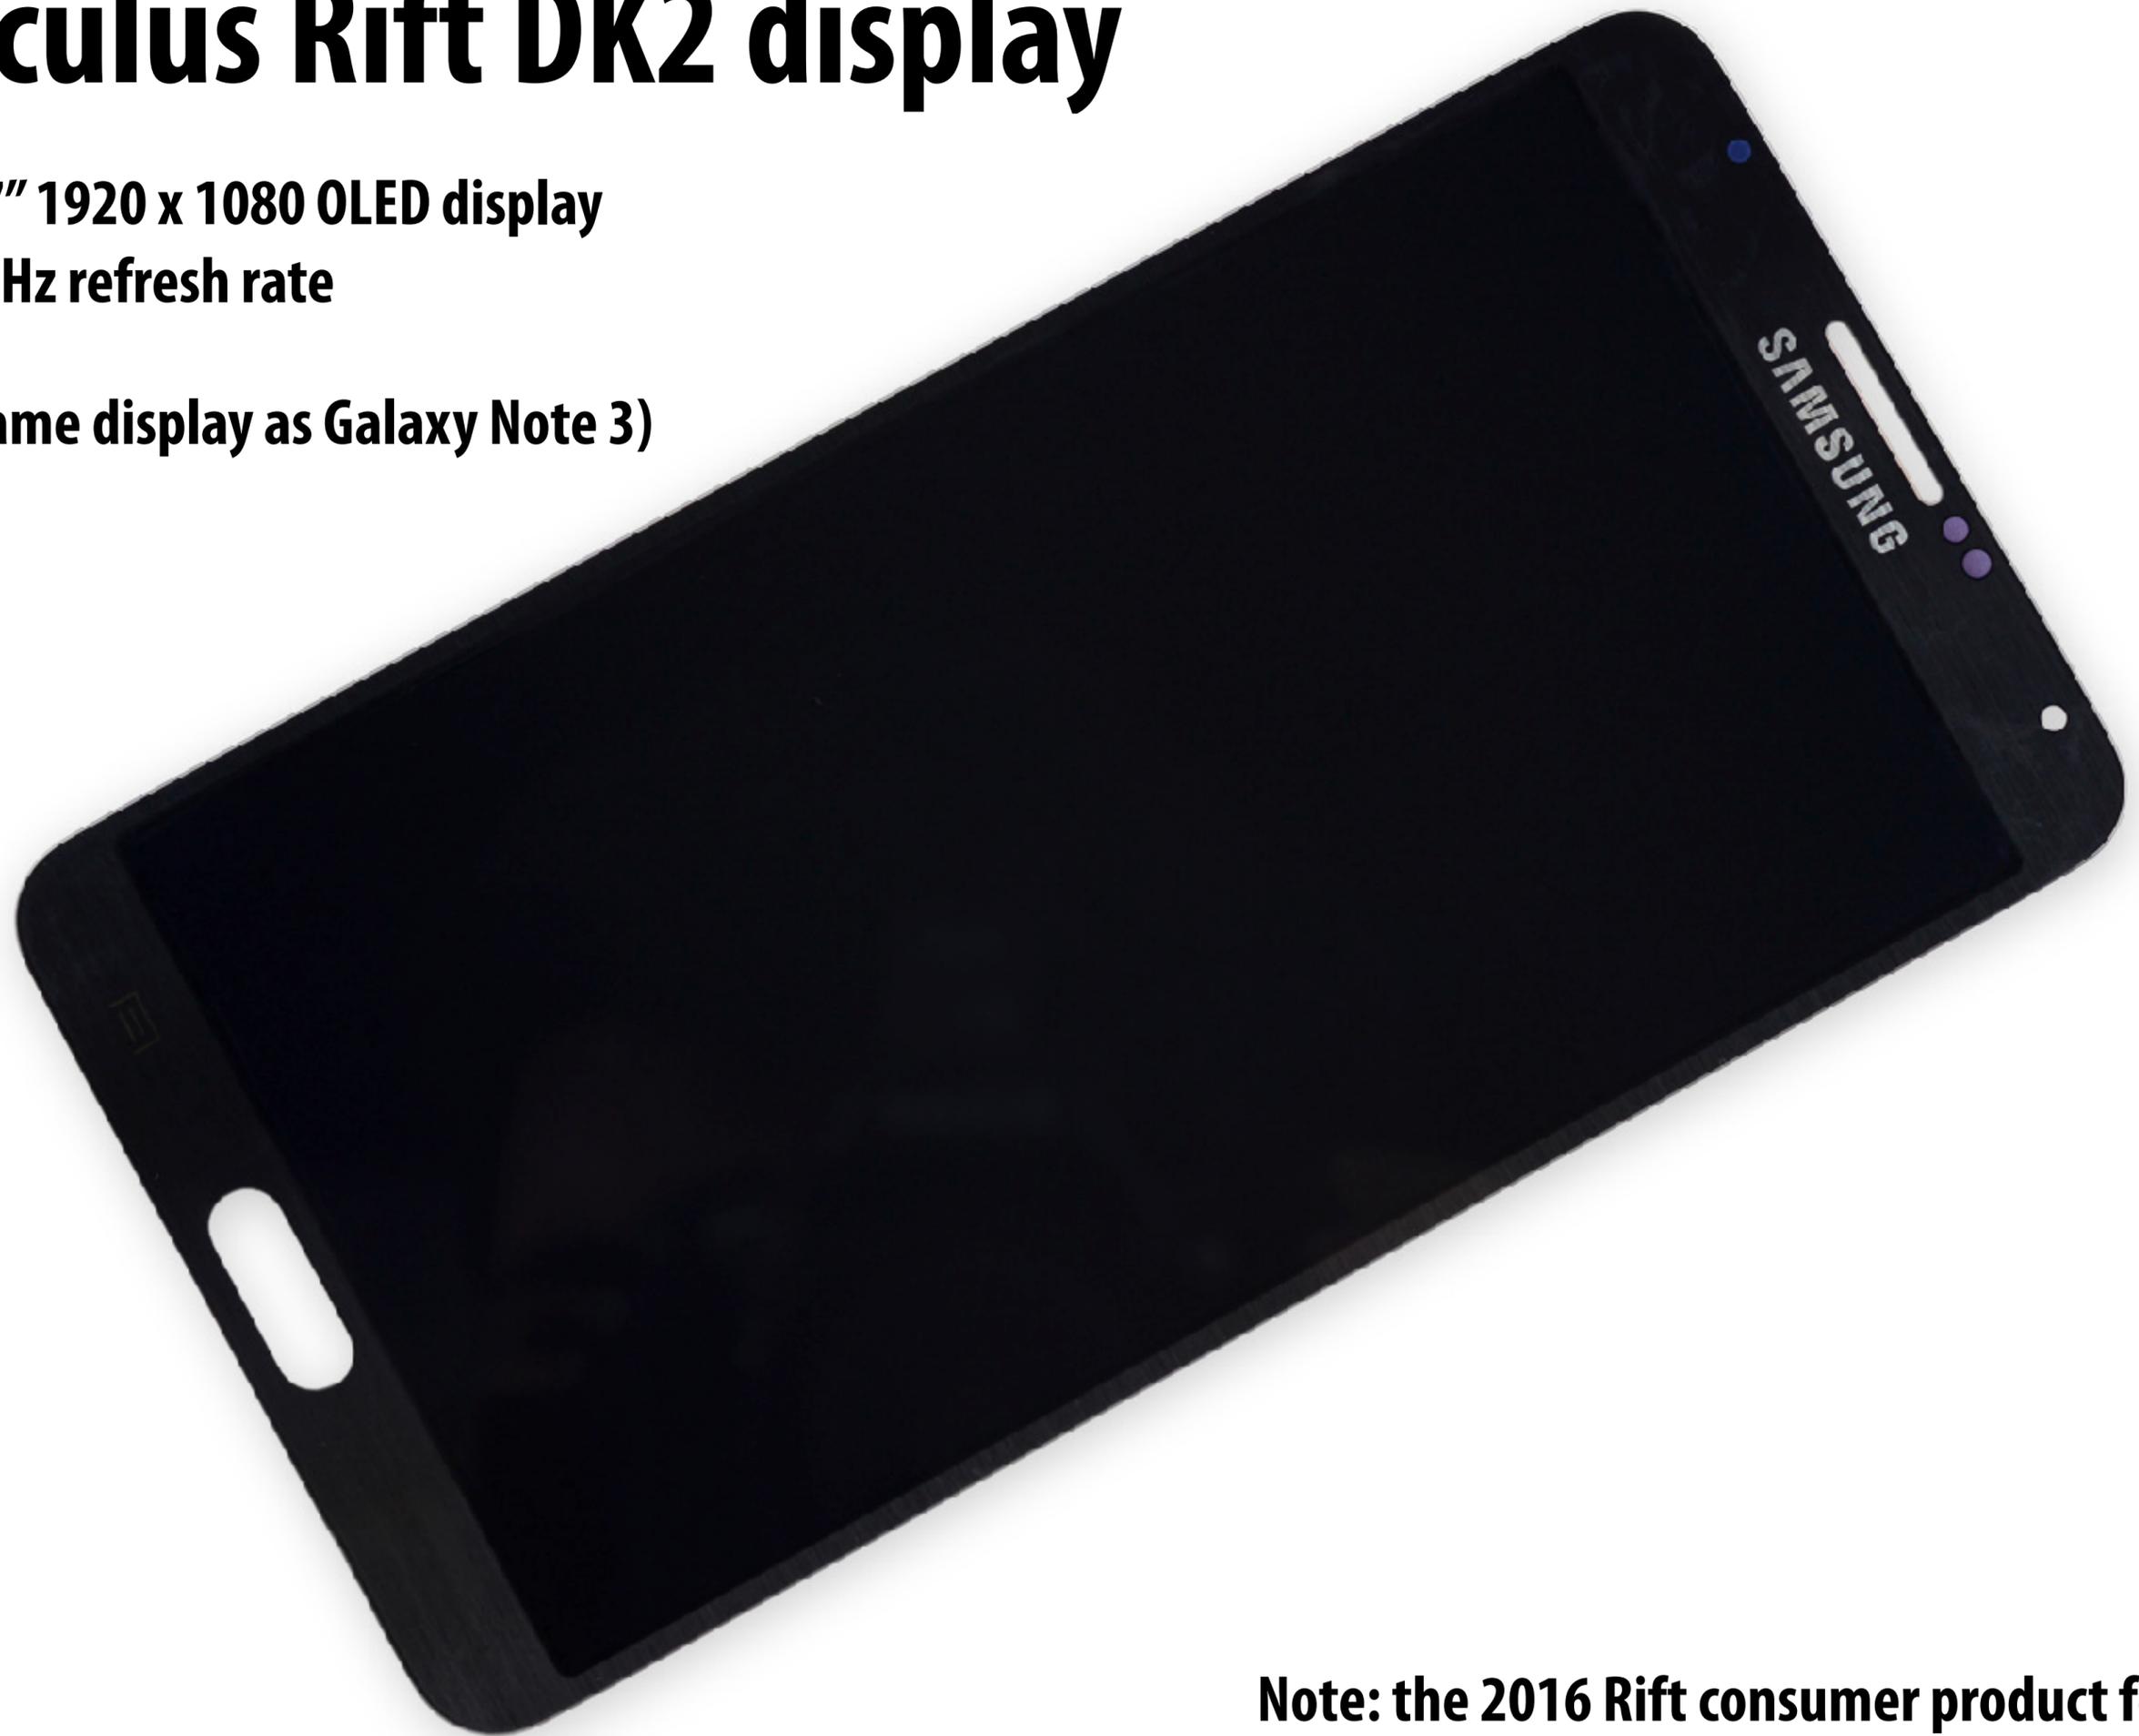

# Oculus Rift DK2 display

**5.7" 1920 x 1080 OLED display**

**75 Hz refresh rate**

**(Same display as Galaxy Note 3)**

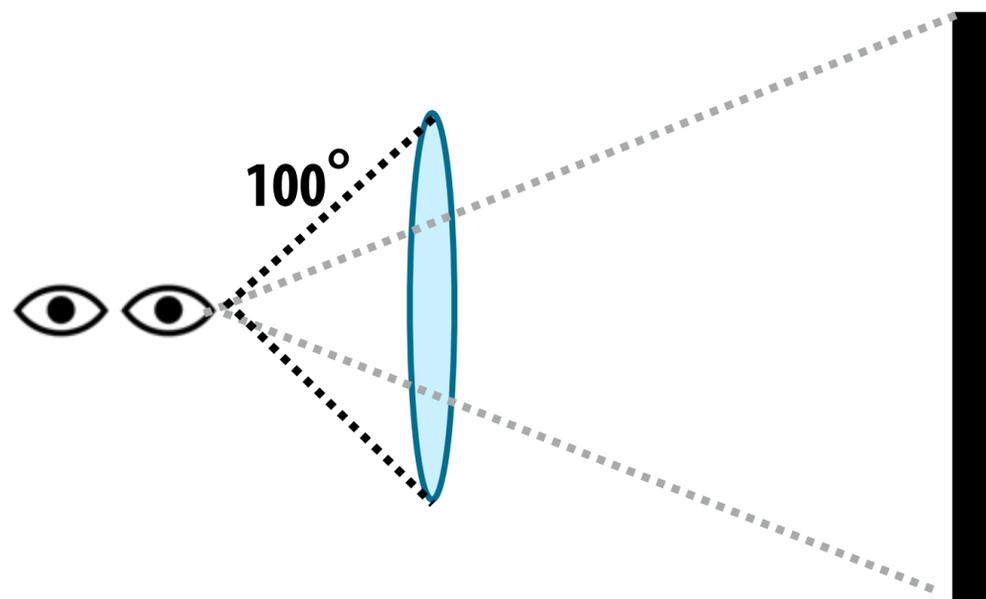

**Note: the 2016 Rift consumer product features two 1080×1200 displays at 90Hz.**

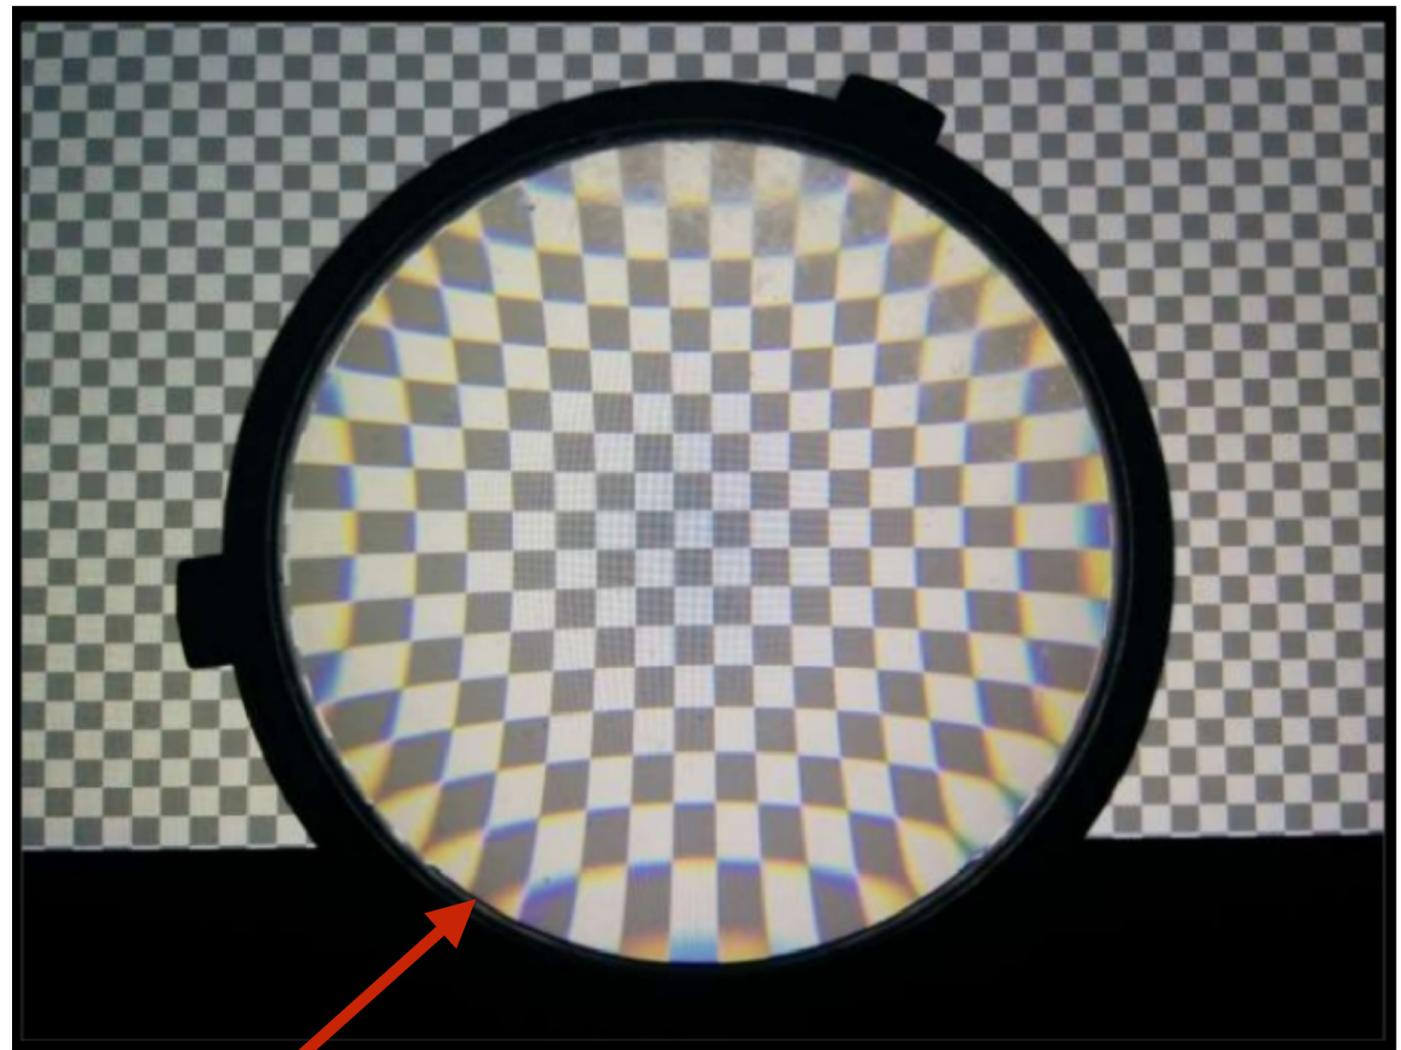

# Oculus Rift DK2 headset

# Requirement: wide field of view

View of checkerboard through Oculus Rift lens

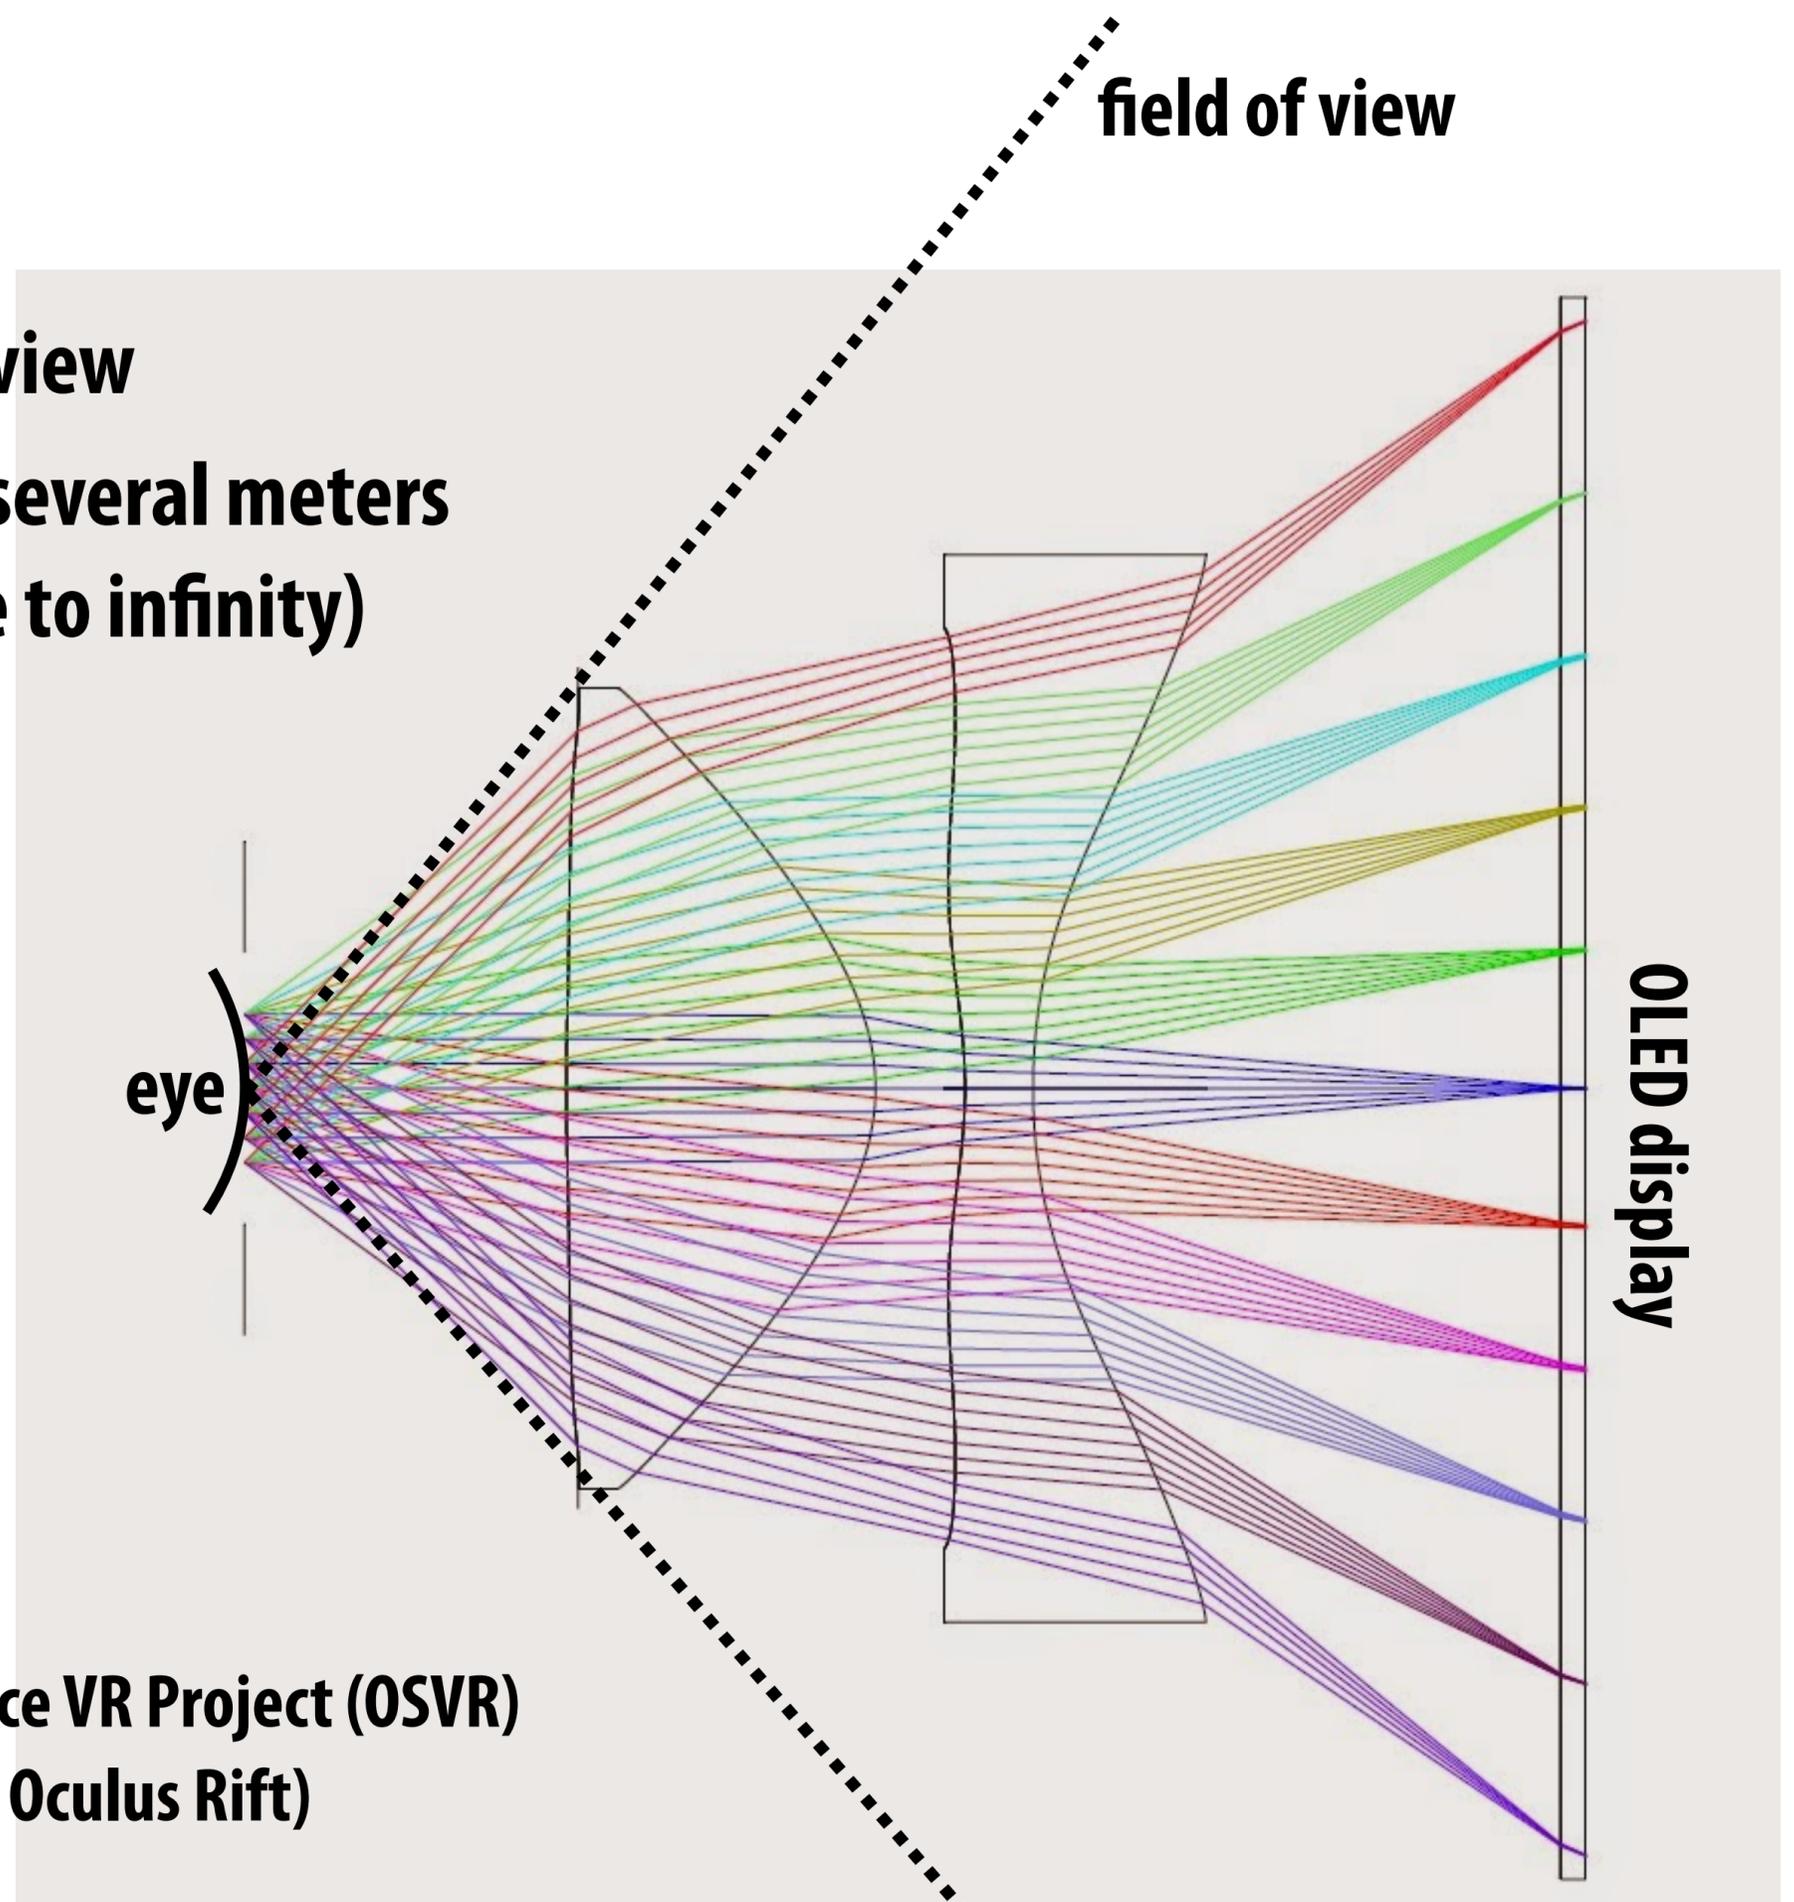

## Lens introduces distortion

- Pincushion distortion
- Chromatic aberration (different wavelengths of light refract by different amount)

# Role of optics

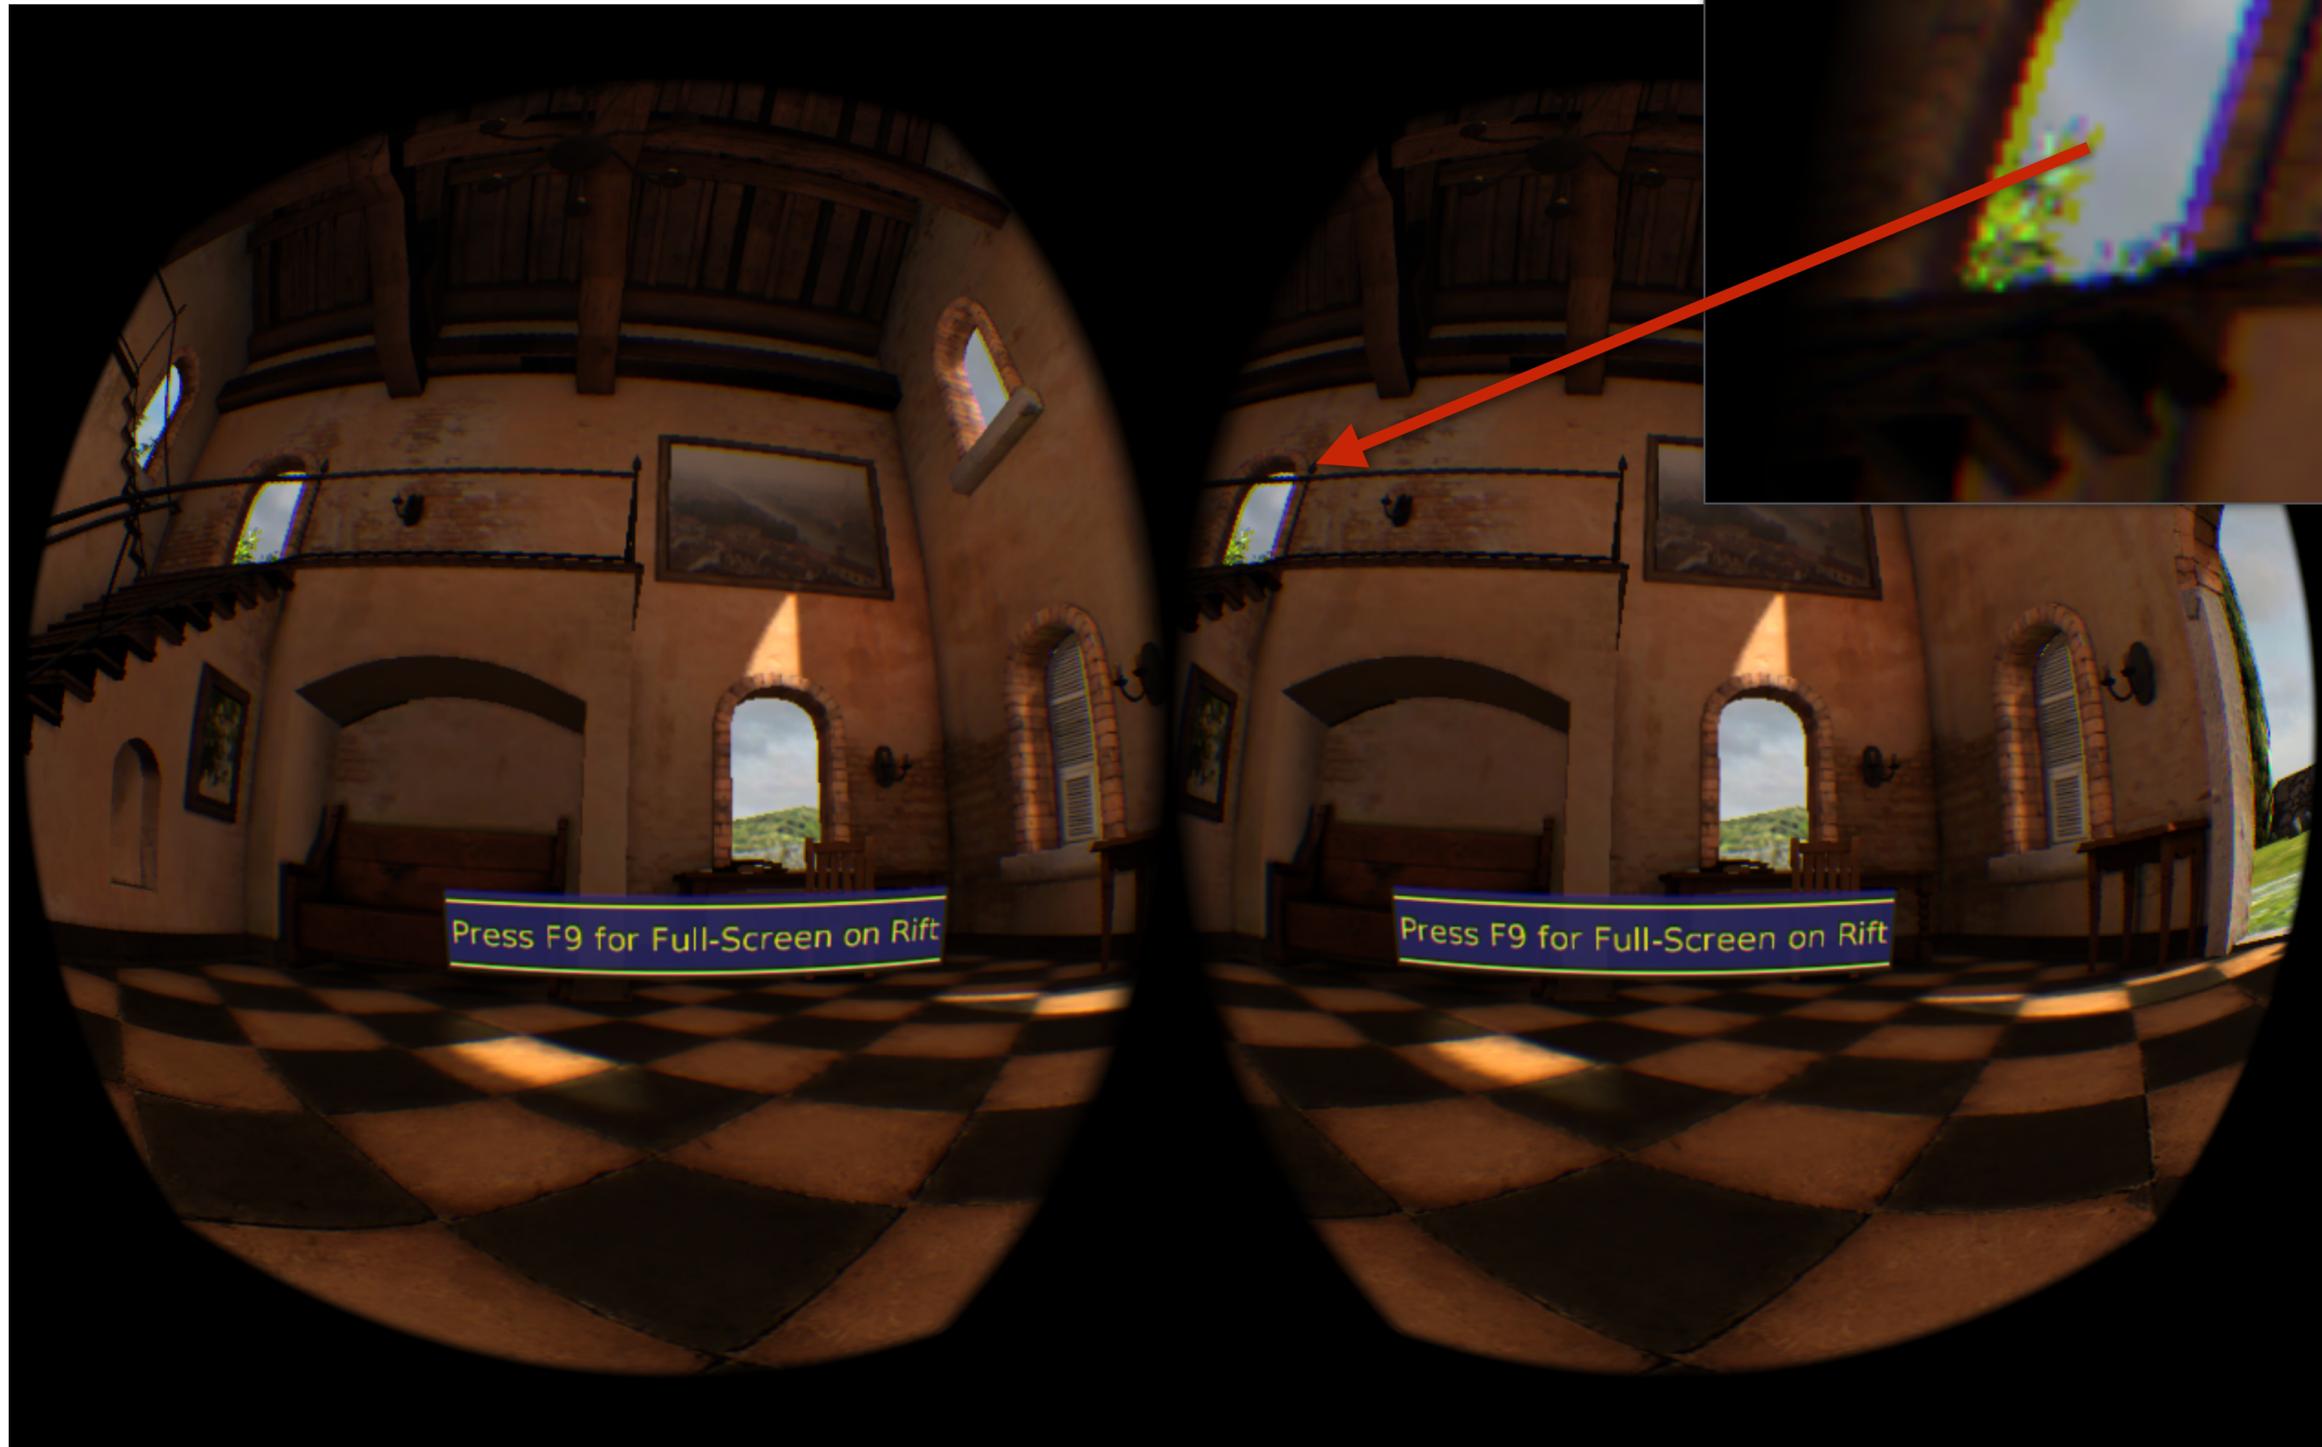

1. Create wide field of view
2. Place focal plane at several meters away from eye (close to infinity)

Lens diagram from Open Source VR Project (OSVR)  
(Not the lens system from the Oculus Rift)

<http://www.osvr.org/>

# Rendered output must compensate for distortion of lens in front of display

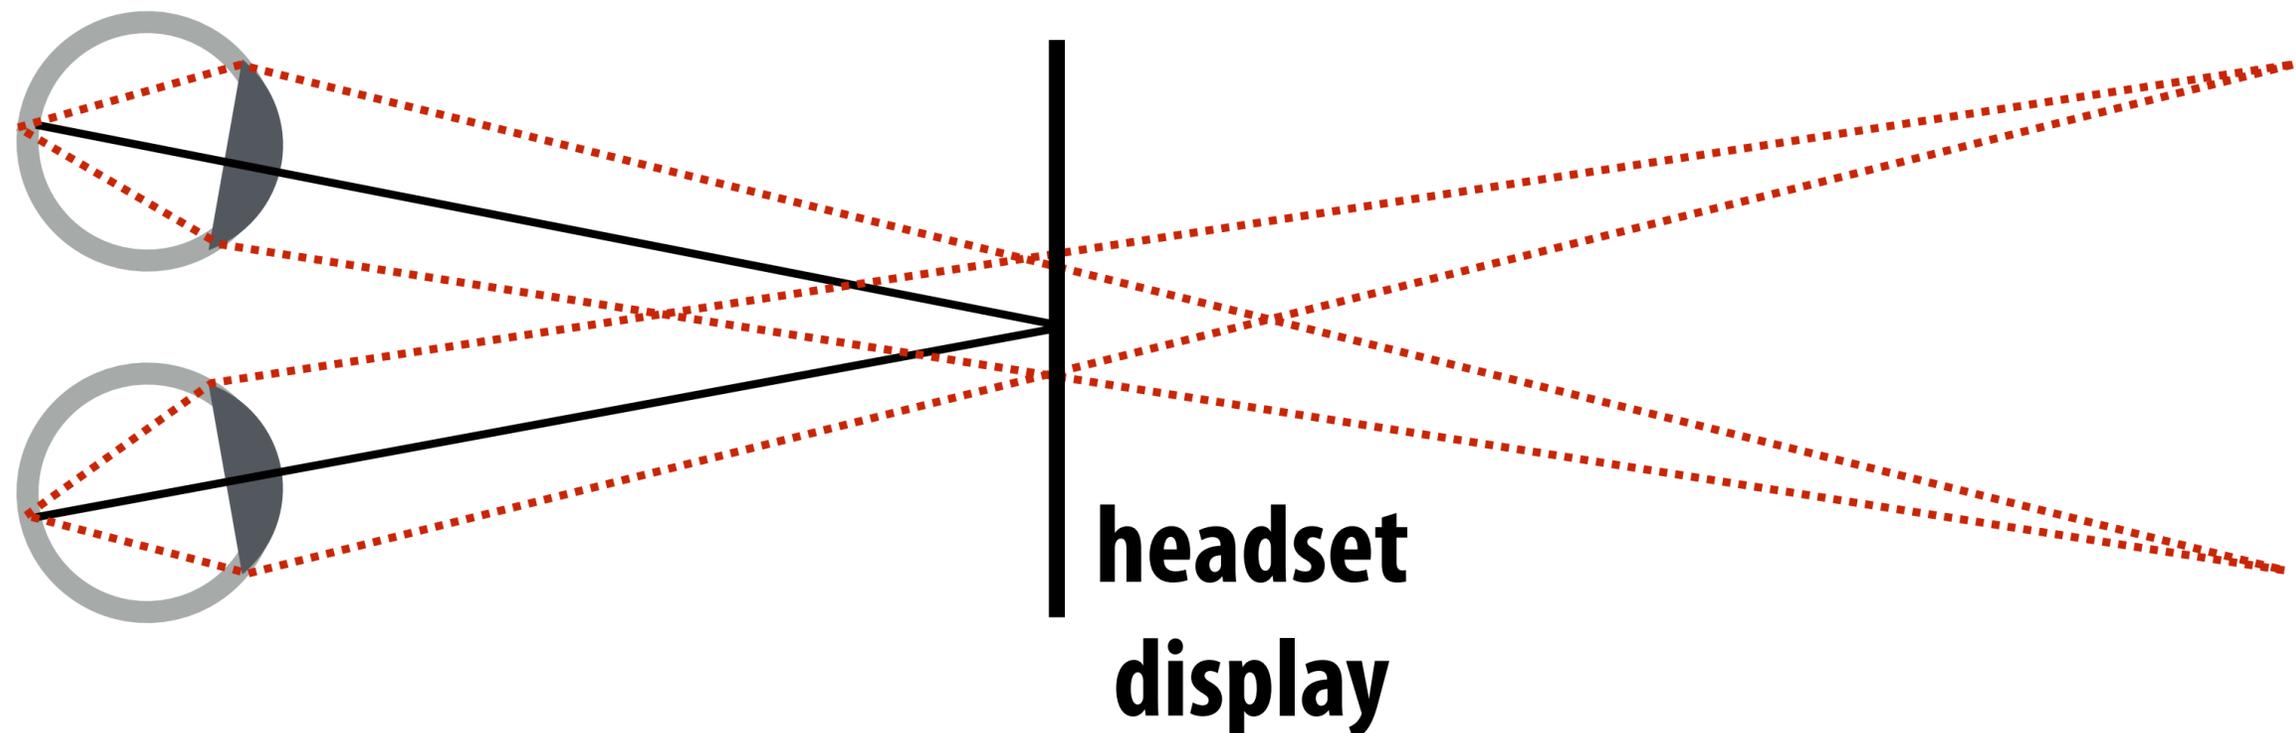

**Step 1: render scene using traditional graphics pipeline at full resolution for each eye**

**Step 2: warp images and composite into frame rendering is viewed correctly after lens distortion**

**(Can apply unique distortion to R, G, B to approximate correction for chromatic aberration)**

# Still have *vergence conflict*...

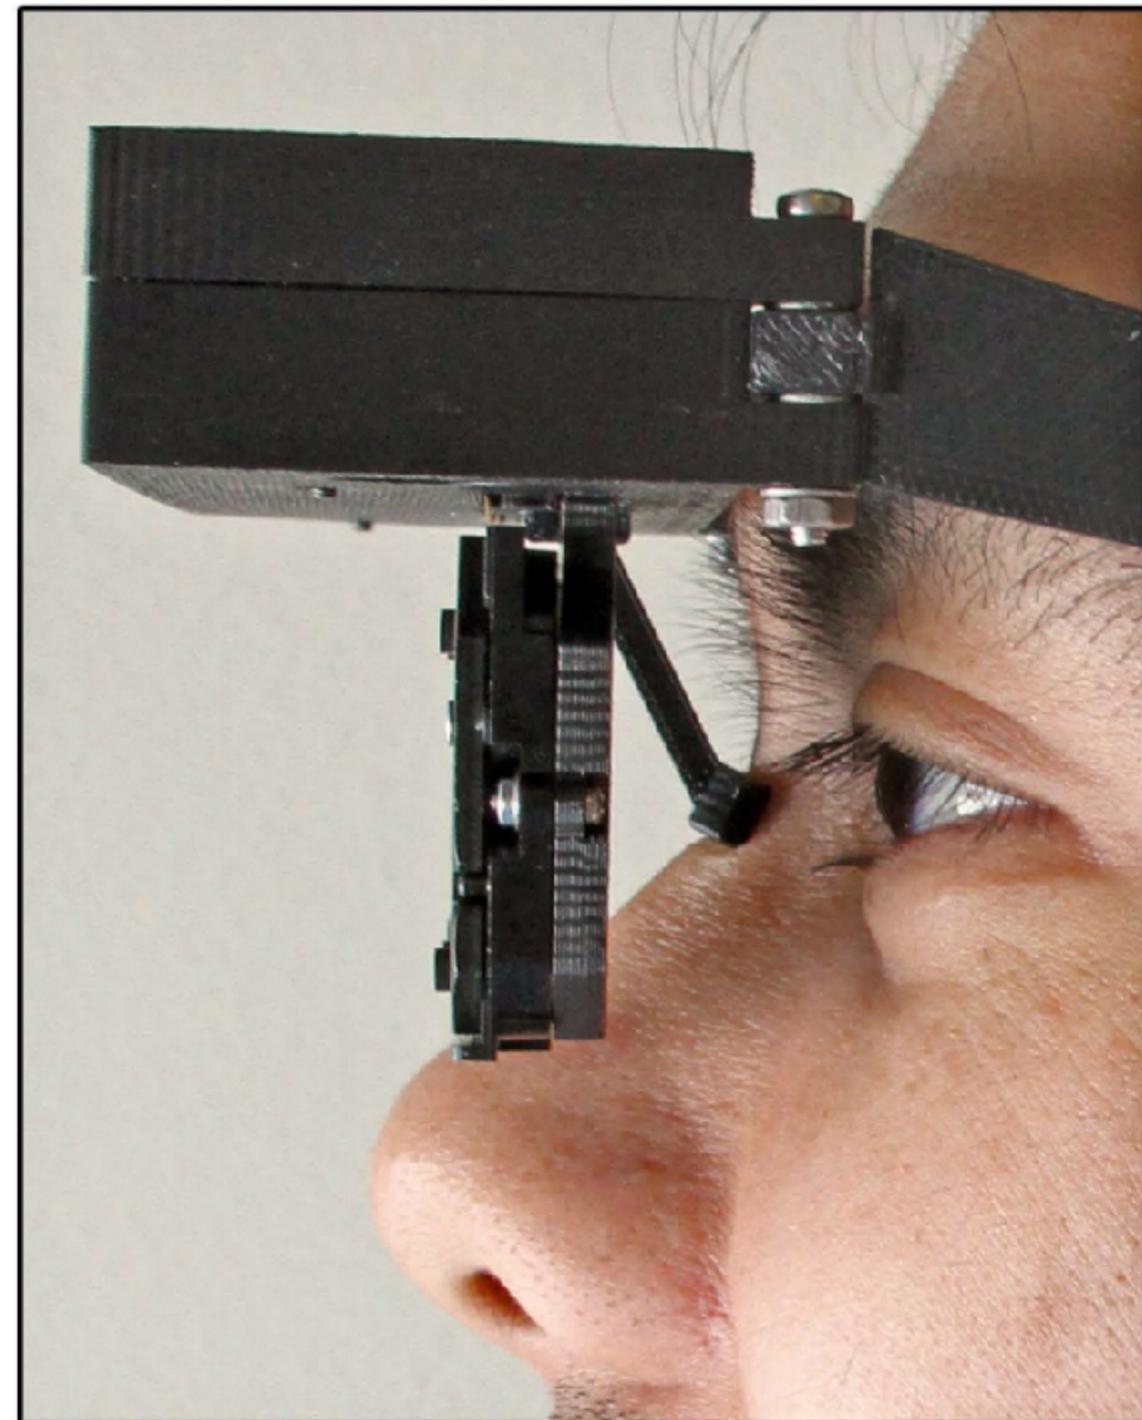

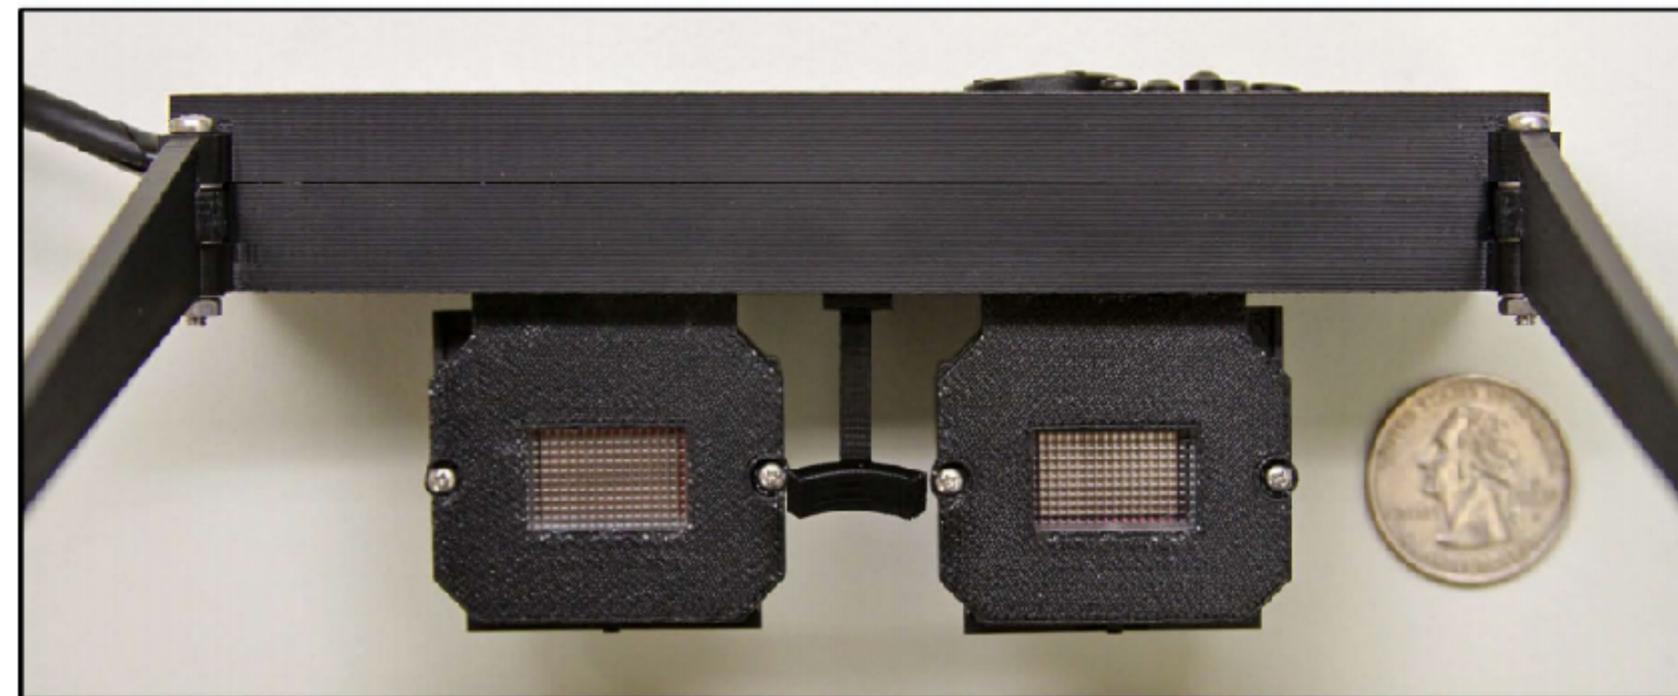

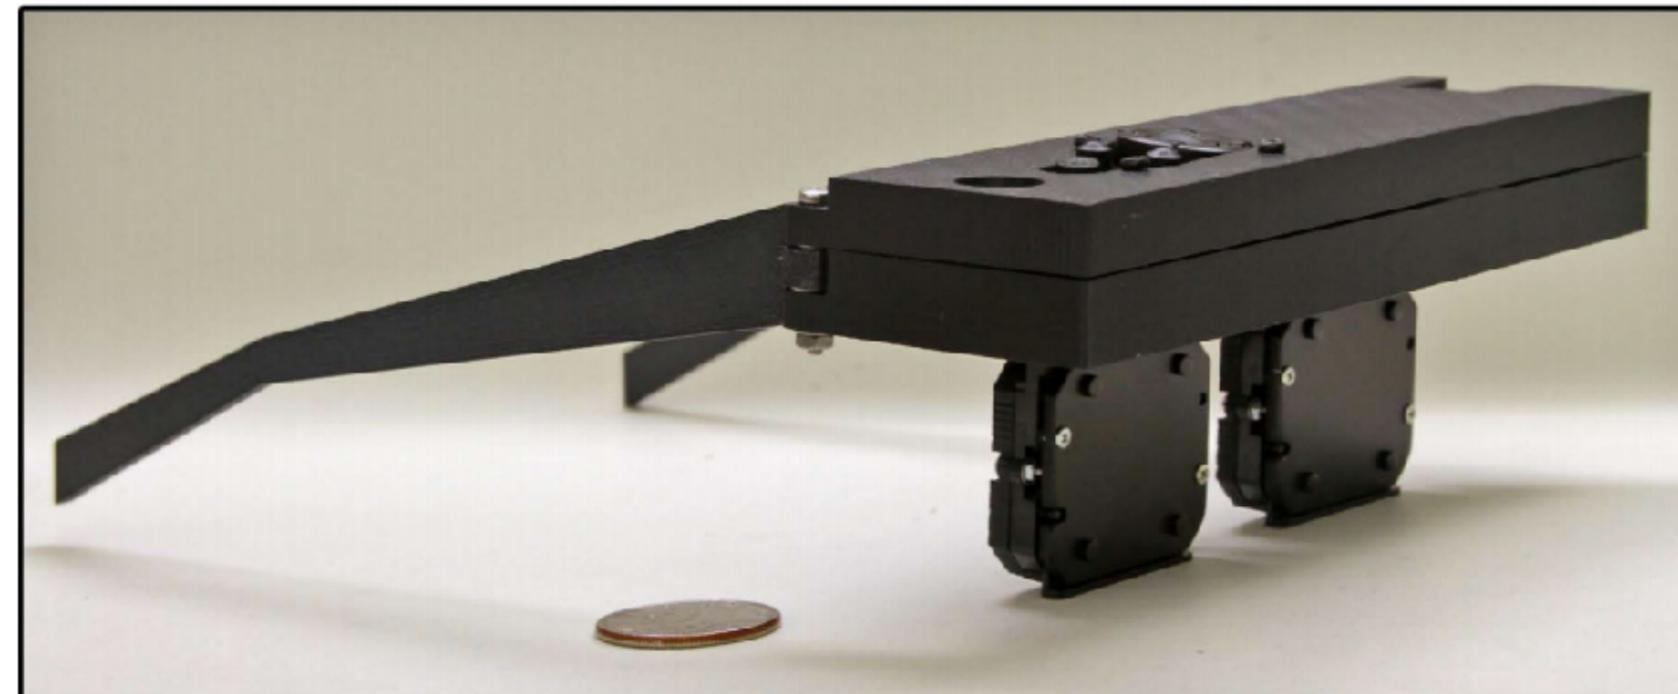

- **Given design of current VR displays, consider what happens when objects are up-close to eye in virtual scene**
  - **Eyes must remain accommodated to near infinity (otherwise image on screen won't be in focus)**
  - **But eyes must converge in attempt to fuse stereoscopic images of object up close**
  - **Brain receives conflicting depth clues... (discomfort, fatigue, nausea)**

***Have to be cross-eyed!***

# Aside: near-eye light field displays

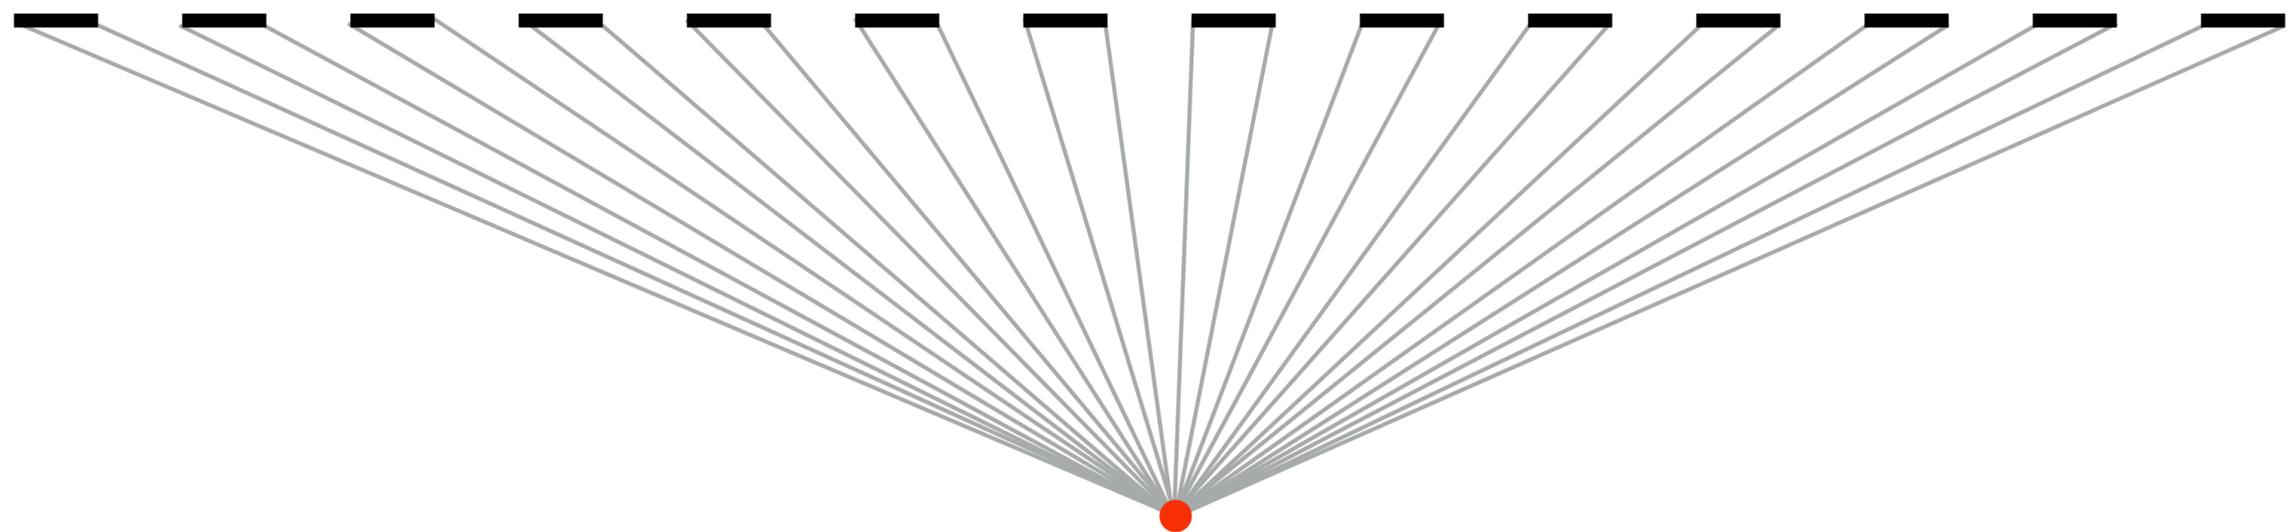

If only you could recreate the true light field, you wouldn't have this problem...

# Challenge: rendering via planar projection

**Recall: rasterization-based graphics is based on perspective projection to plane**

- Reasonable for modest FOV, but distorts image under high FOV
- Recall: VR rendering spans wide FOV

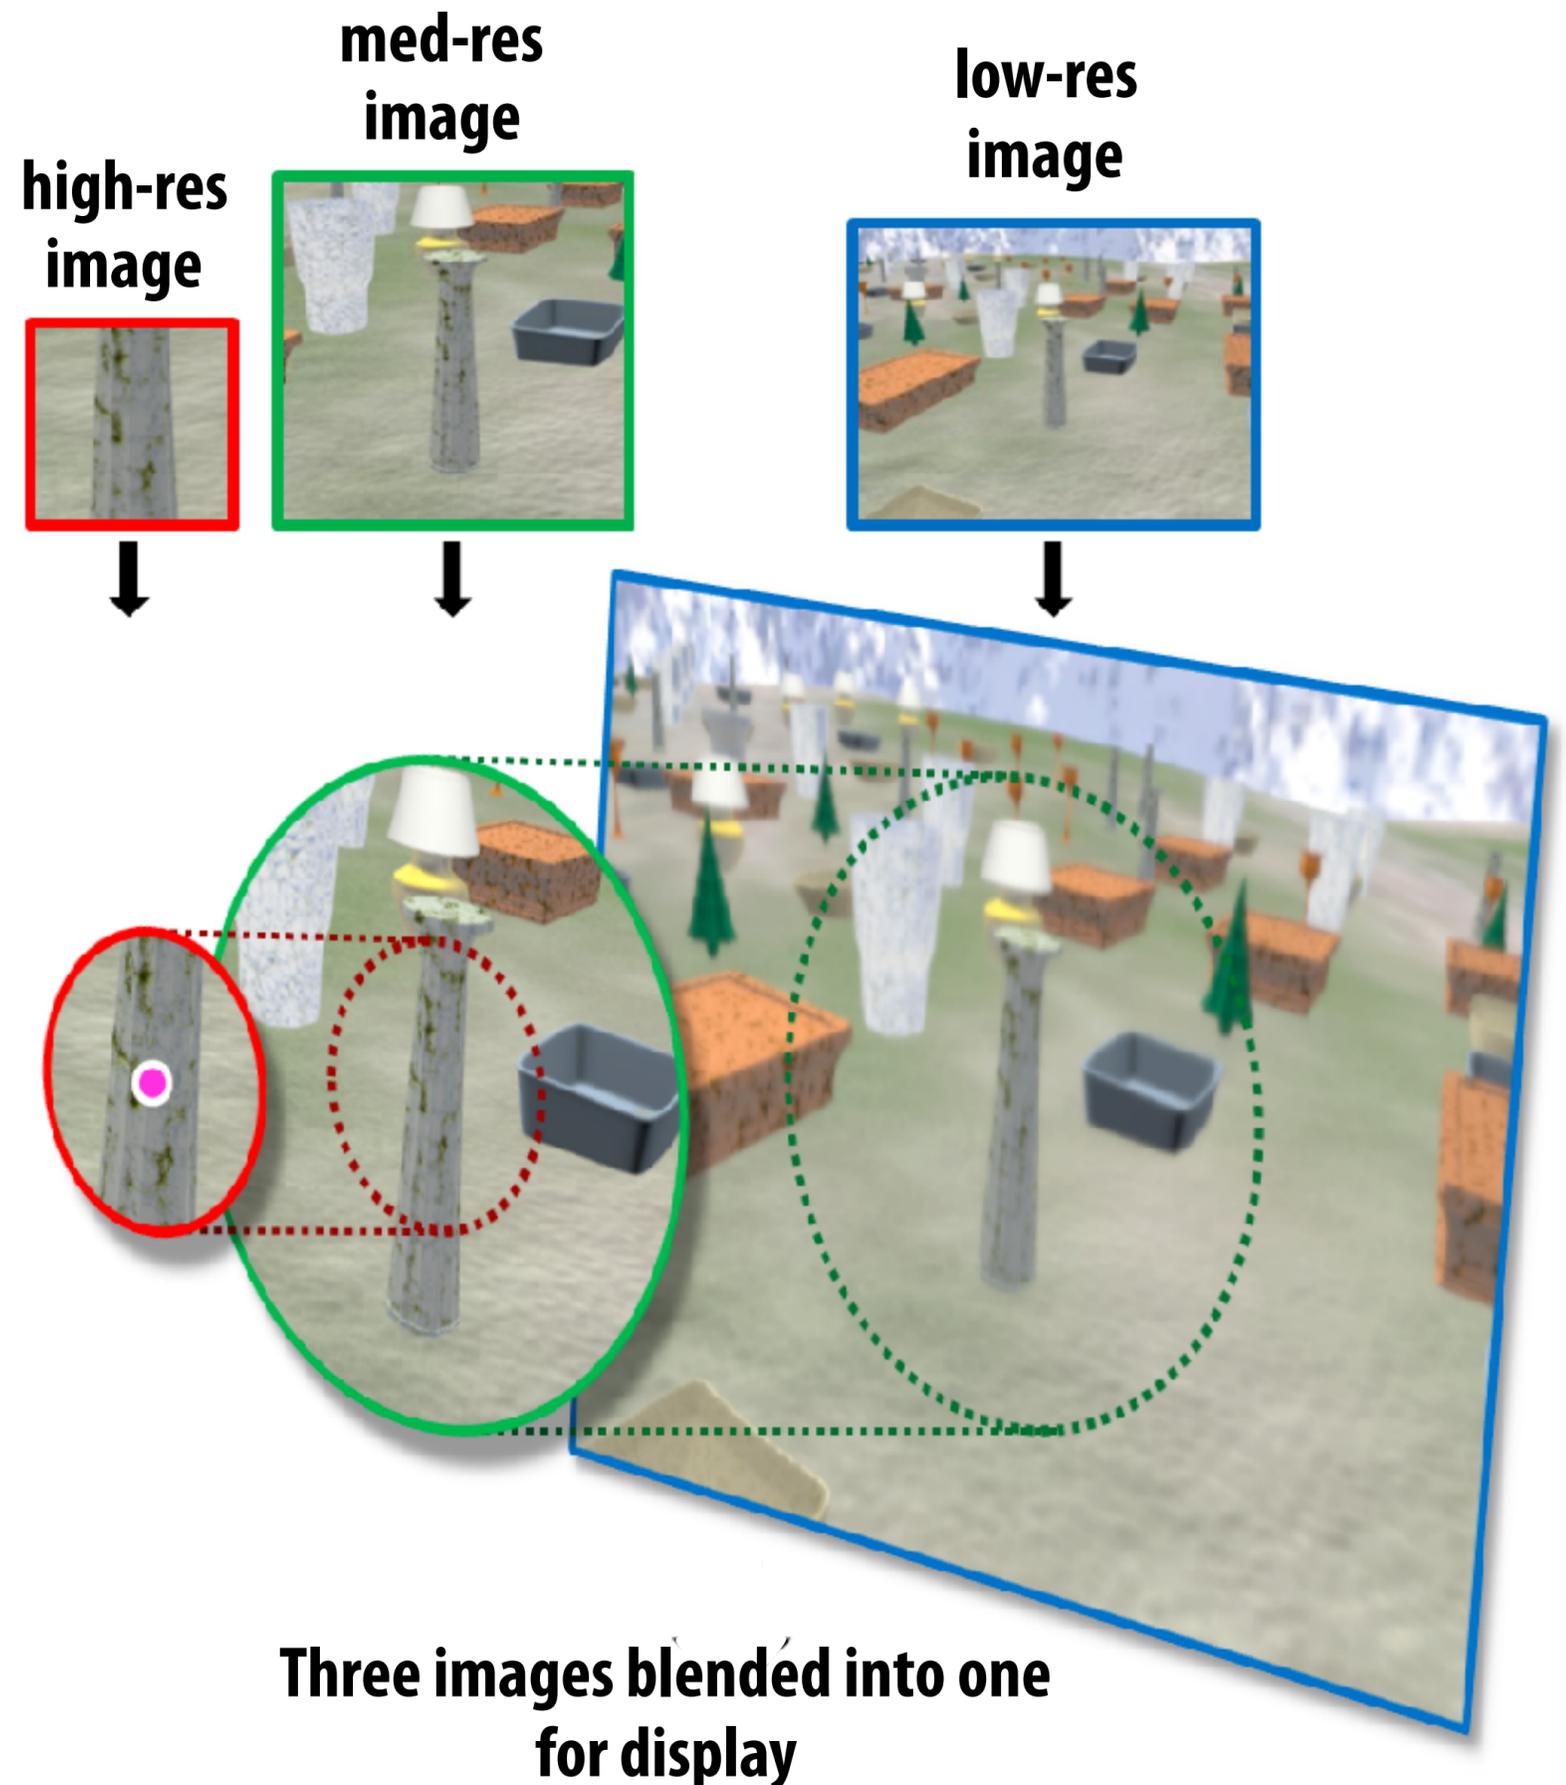

**Pixels span larger angle in center of image  
(lowest angular resolution in center)**

**Future investigations may consider: curved displays, ray casting to achieve uniform angular resolution, rendering with piecewise linear projection plane (different plane per tile of screen)**

# Foveated rendering

**Idea: track user's gaze, render with increasingly lower resolution farther away from gaze point**

# More recent/near future VR system

Low-latency image processing  
for subject tracking

High-resolution, high-frame rate,  
wide-field of view display

Massive parallel computation for  
high-resolution rendering

Exceptionally high bandwidth connection  
between renderer and display:  
e.g., 4K x 4K per eye at 90 fps!

In headset motion/accel  
sensors + **eye tracker**

On headset graphics  
processor for sensor  
processing and re-  
projection

# Summary: virtual reality presents many new challenges for graphics systems developers

- **Major goal: minimize latency of head movement to photons**
  - Requires low latency tracking (not discussed today)
    - Combination of external camera image processing (vision) and high rate headset sensors
    - Heavy use of prediction
  - Requires high-performance rendering
    - High-resolution, wide field-of-view output
    - High frame-rate
    - Rendering must compensate for constraints of display system:
      - Optical distortion (geometric, chromatic)
      - Temporal offsets in rows of pixels
- **Significant research interest in display technologies that are alternatives to flat screens with lenses in front of them**

# Interest in acquiring VR content

**Google's JumpVR video:  
16 4K GoPro cameras**

**Consider challenge of:  
Registering/3D align video stream (on site)  
Broadcast encoded video stream across the  
country to 50 million viewers**

**Lytro Immerse**  
(leveraging *light field camera*  
technology to acquire VR content)

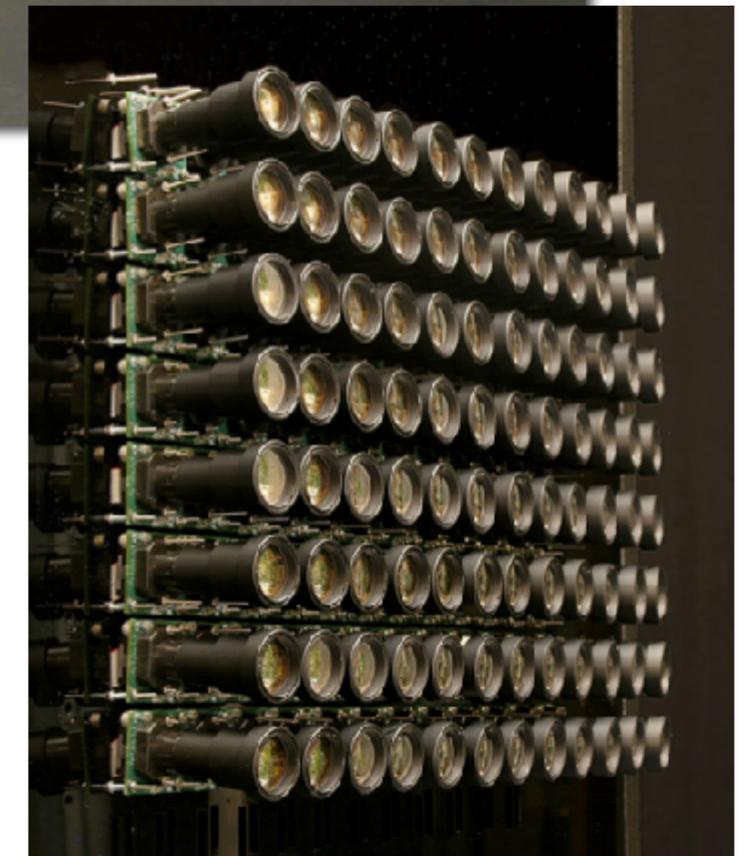

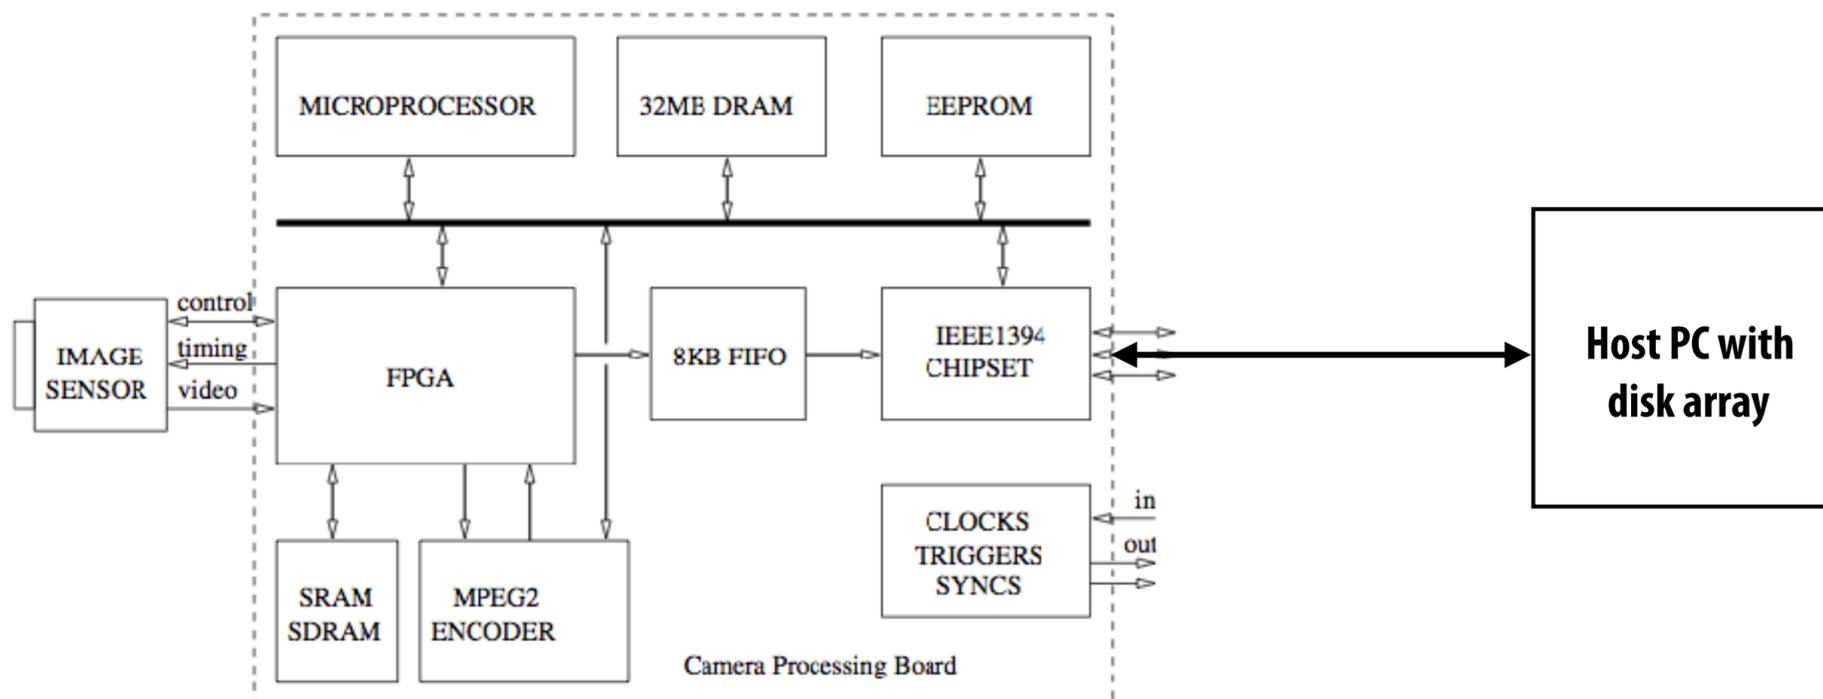

# Stanford Camera Array

Wilburn et al. 2005

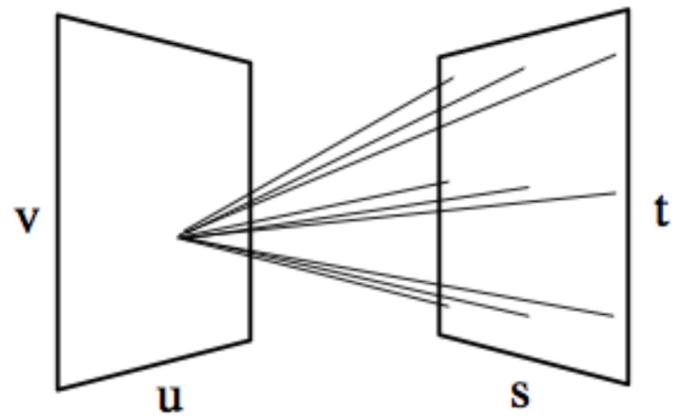

640 x 480 tightly synchronized,  
repositionable cameras

Custom processing board per camera

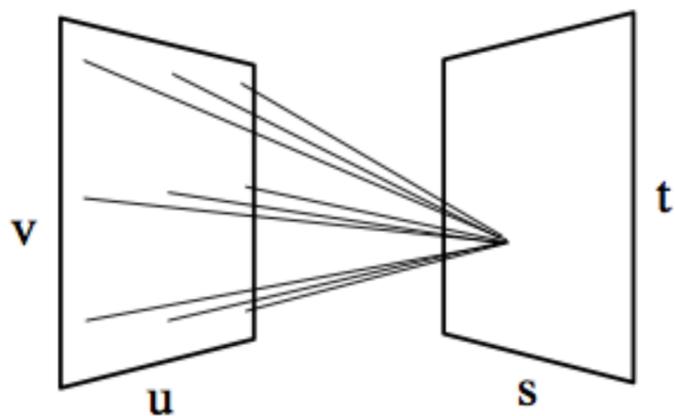

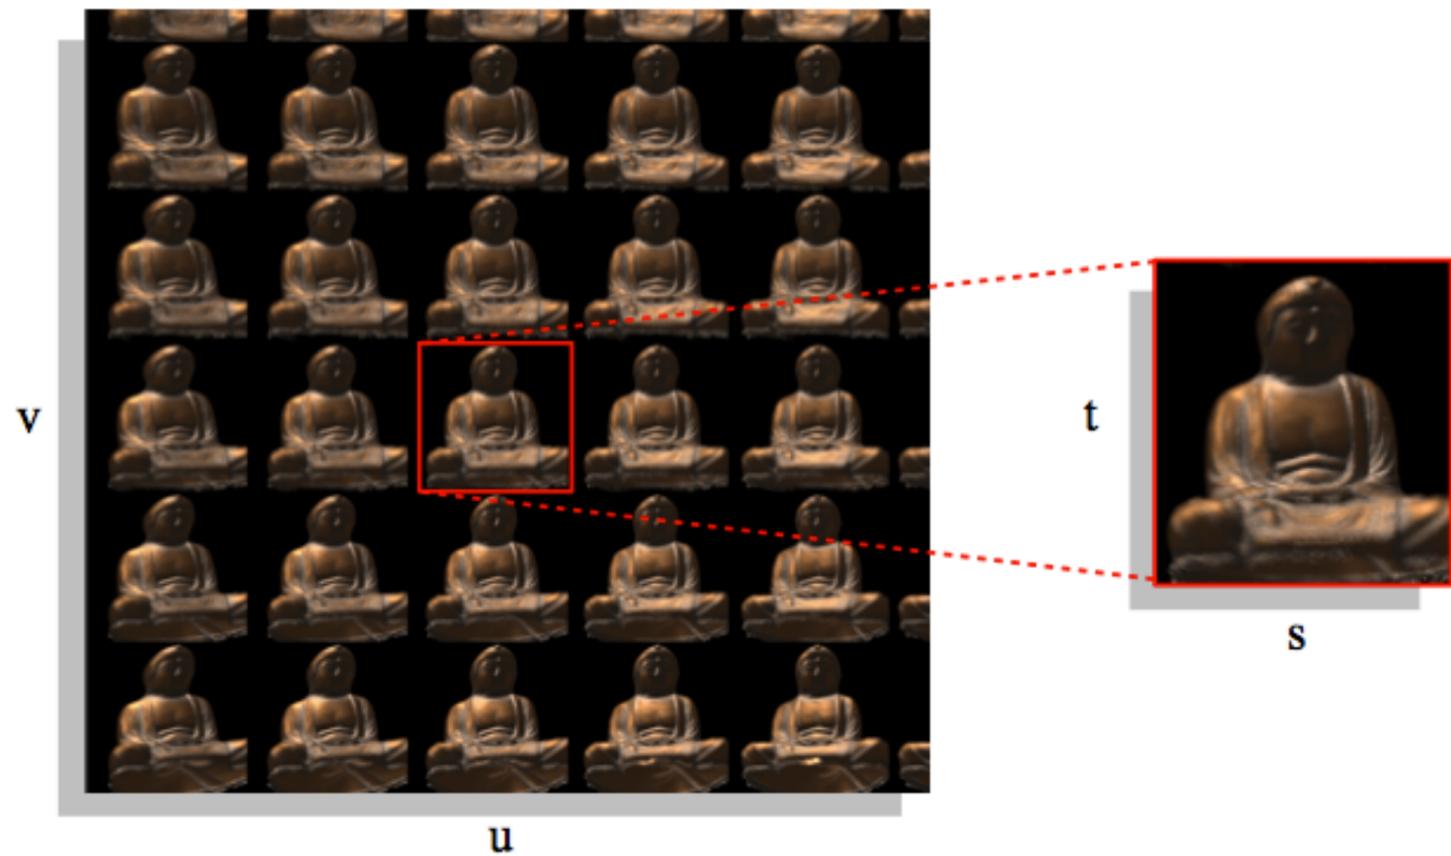

Tethered to PCs for additional  
processing/storage

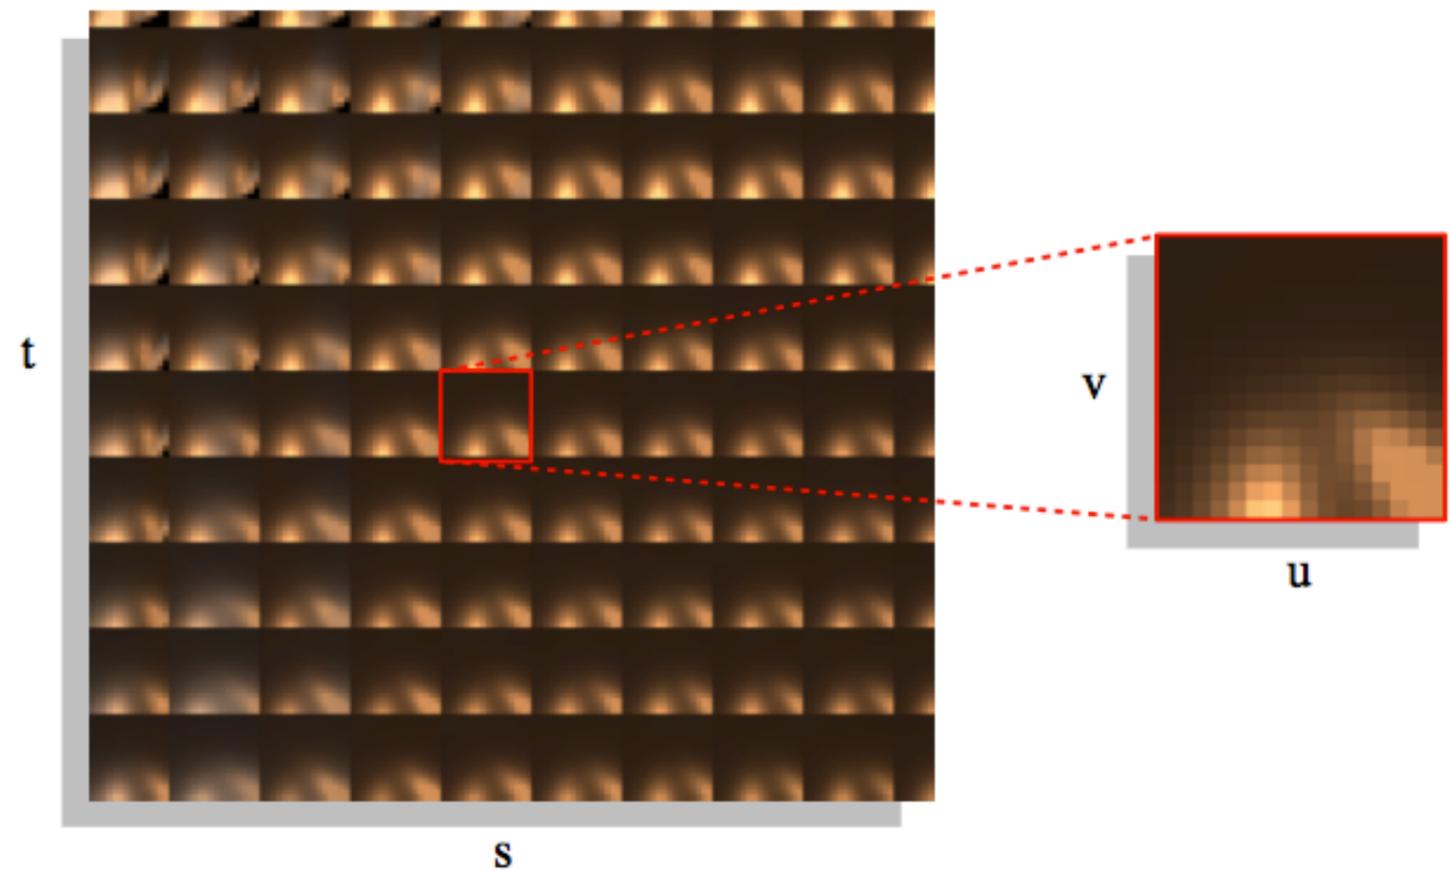

# Light field storage layouts

(a)

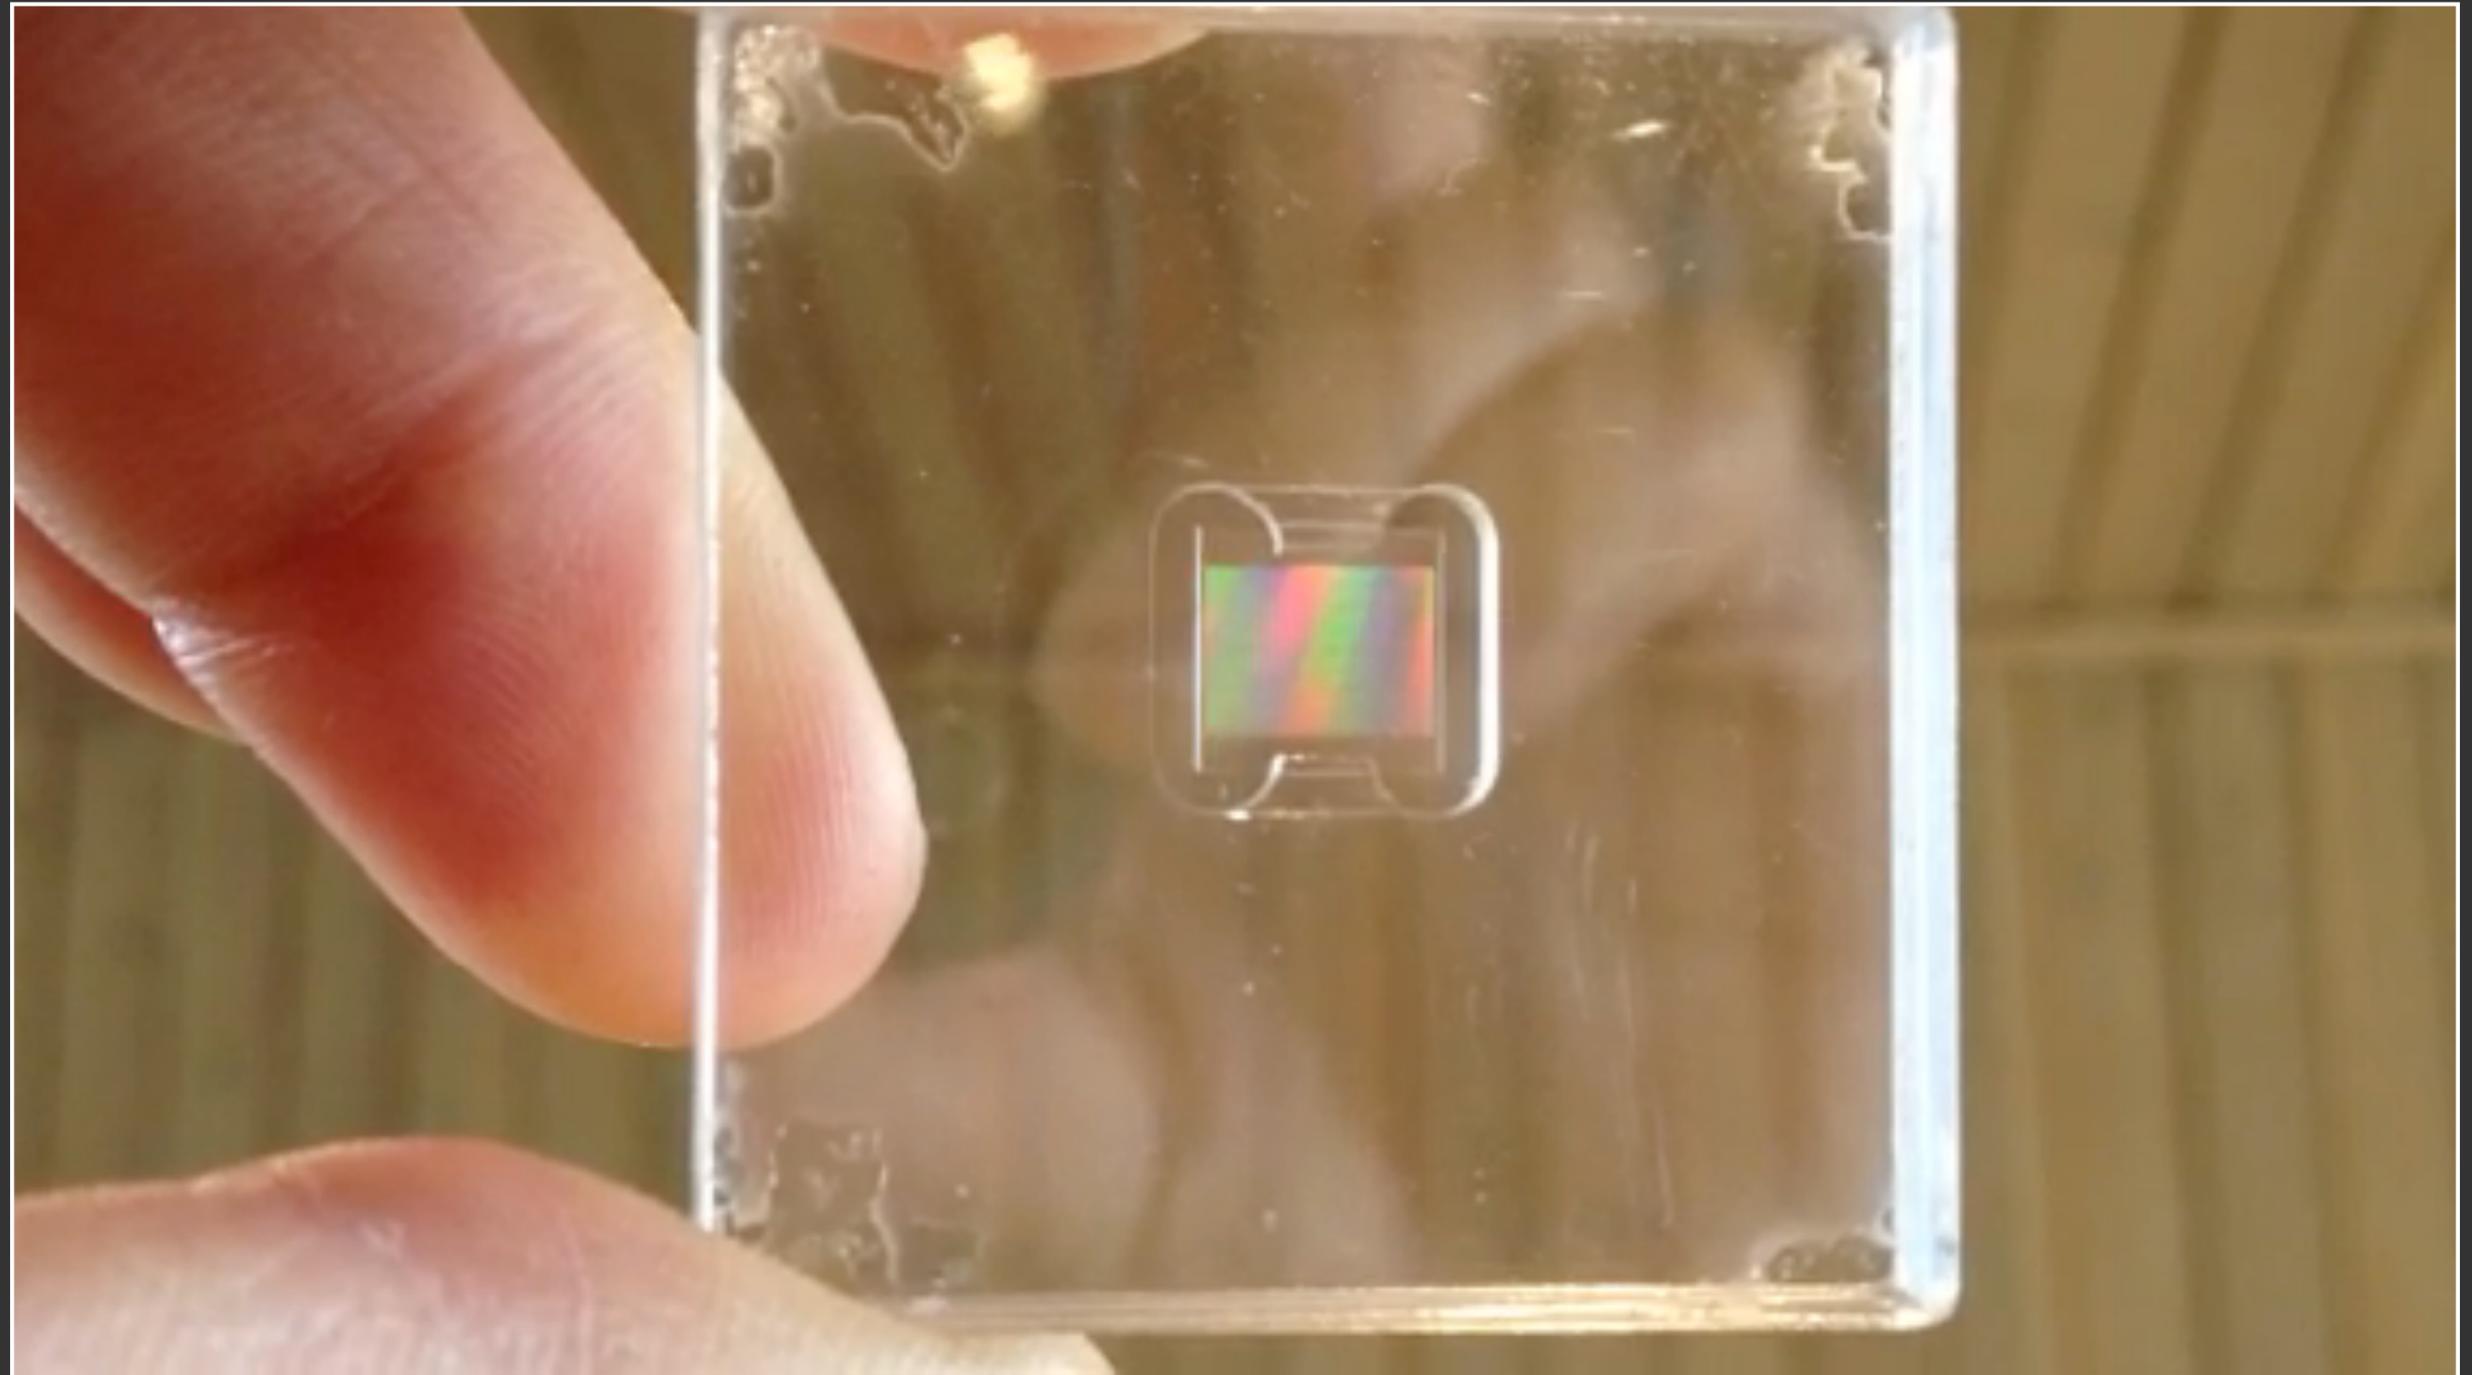

(b)

# MicroLens Array

# Application: computational Change of Viewpoint

---

**Lateral movement (right)**

# Computational Photography

Even with standard digital camera, the values of pixels in photograph you see on screen are quite different than the values output by the photosensor in the original camera

*Computation has become a fundamental aspect of producing high-quality pictures*

# Computational Photography

- Since we're processing images anyway, why not take it even further?

# Example: HDR Tone Mapping

- For any real camera, single photo has limits on intensity range

# Example: HDR Tone Mapping

- For any real camera, single photo has limits on intensity range

# Example: HDR Tone Mapping

- For any real camera, single photo has limits on intensity range

# Example: HDR Tone Mapping

- Use algorithms to combine images, convey original “feeling”

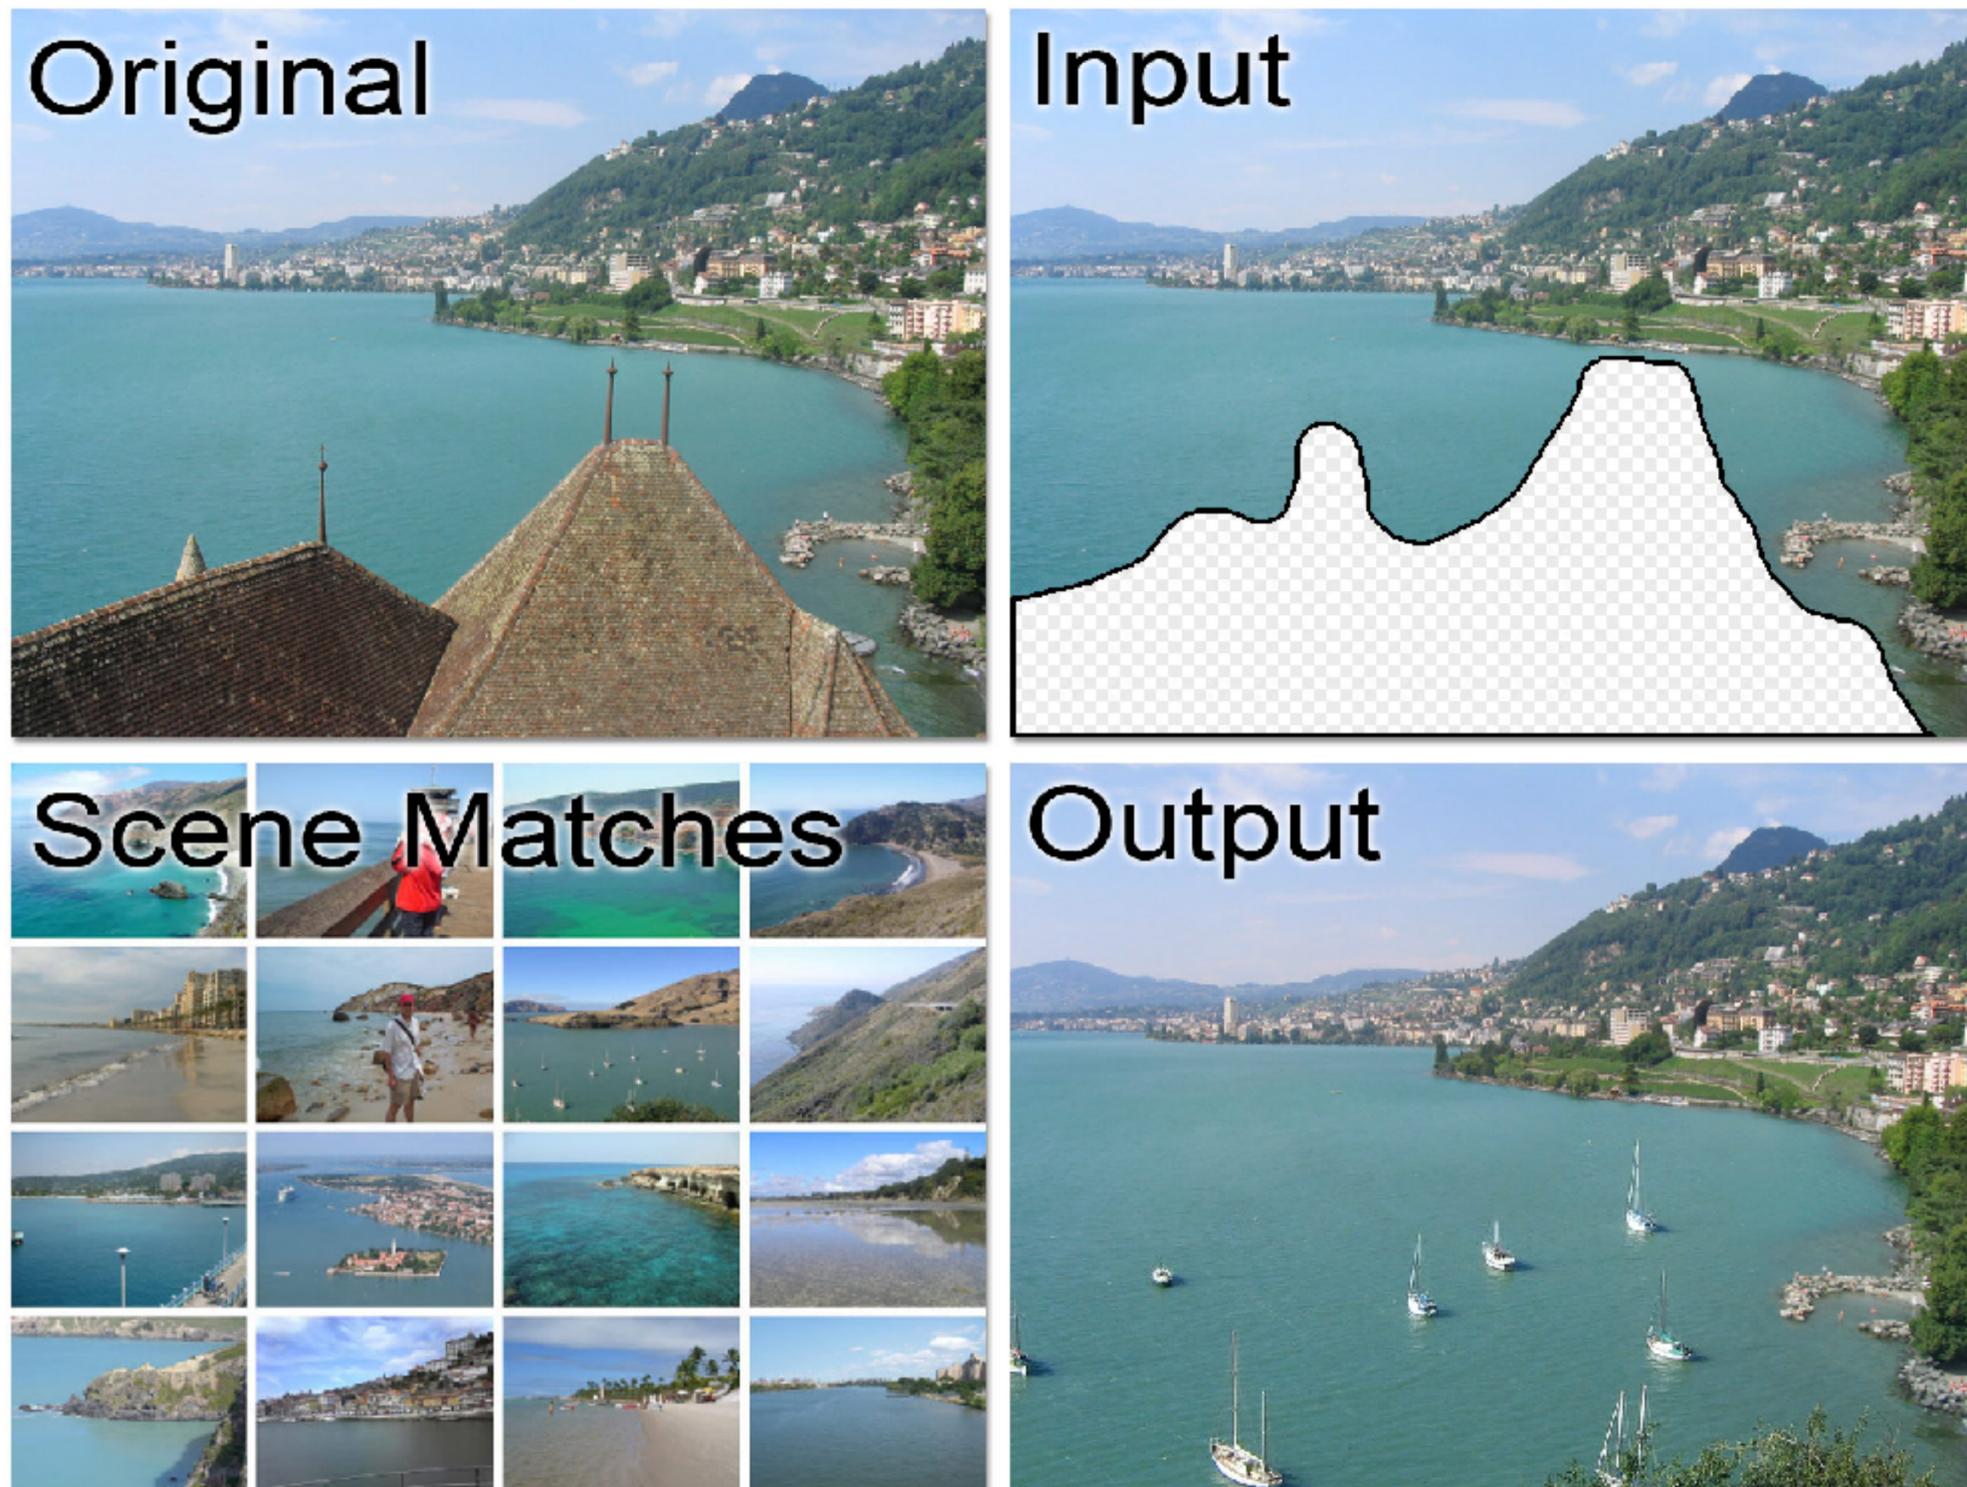

# Example: Image Completion

- Fill in missing parts of image

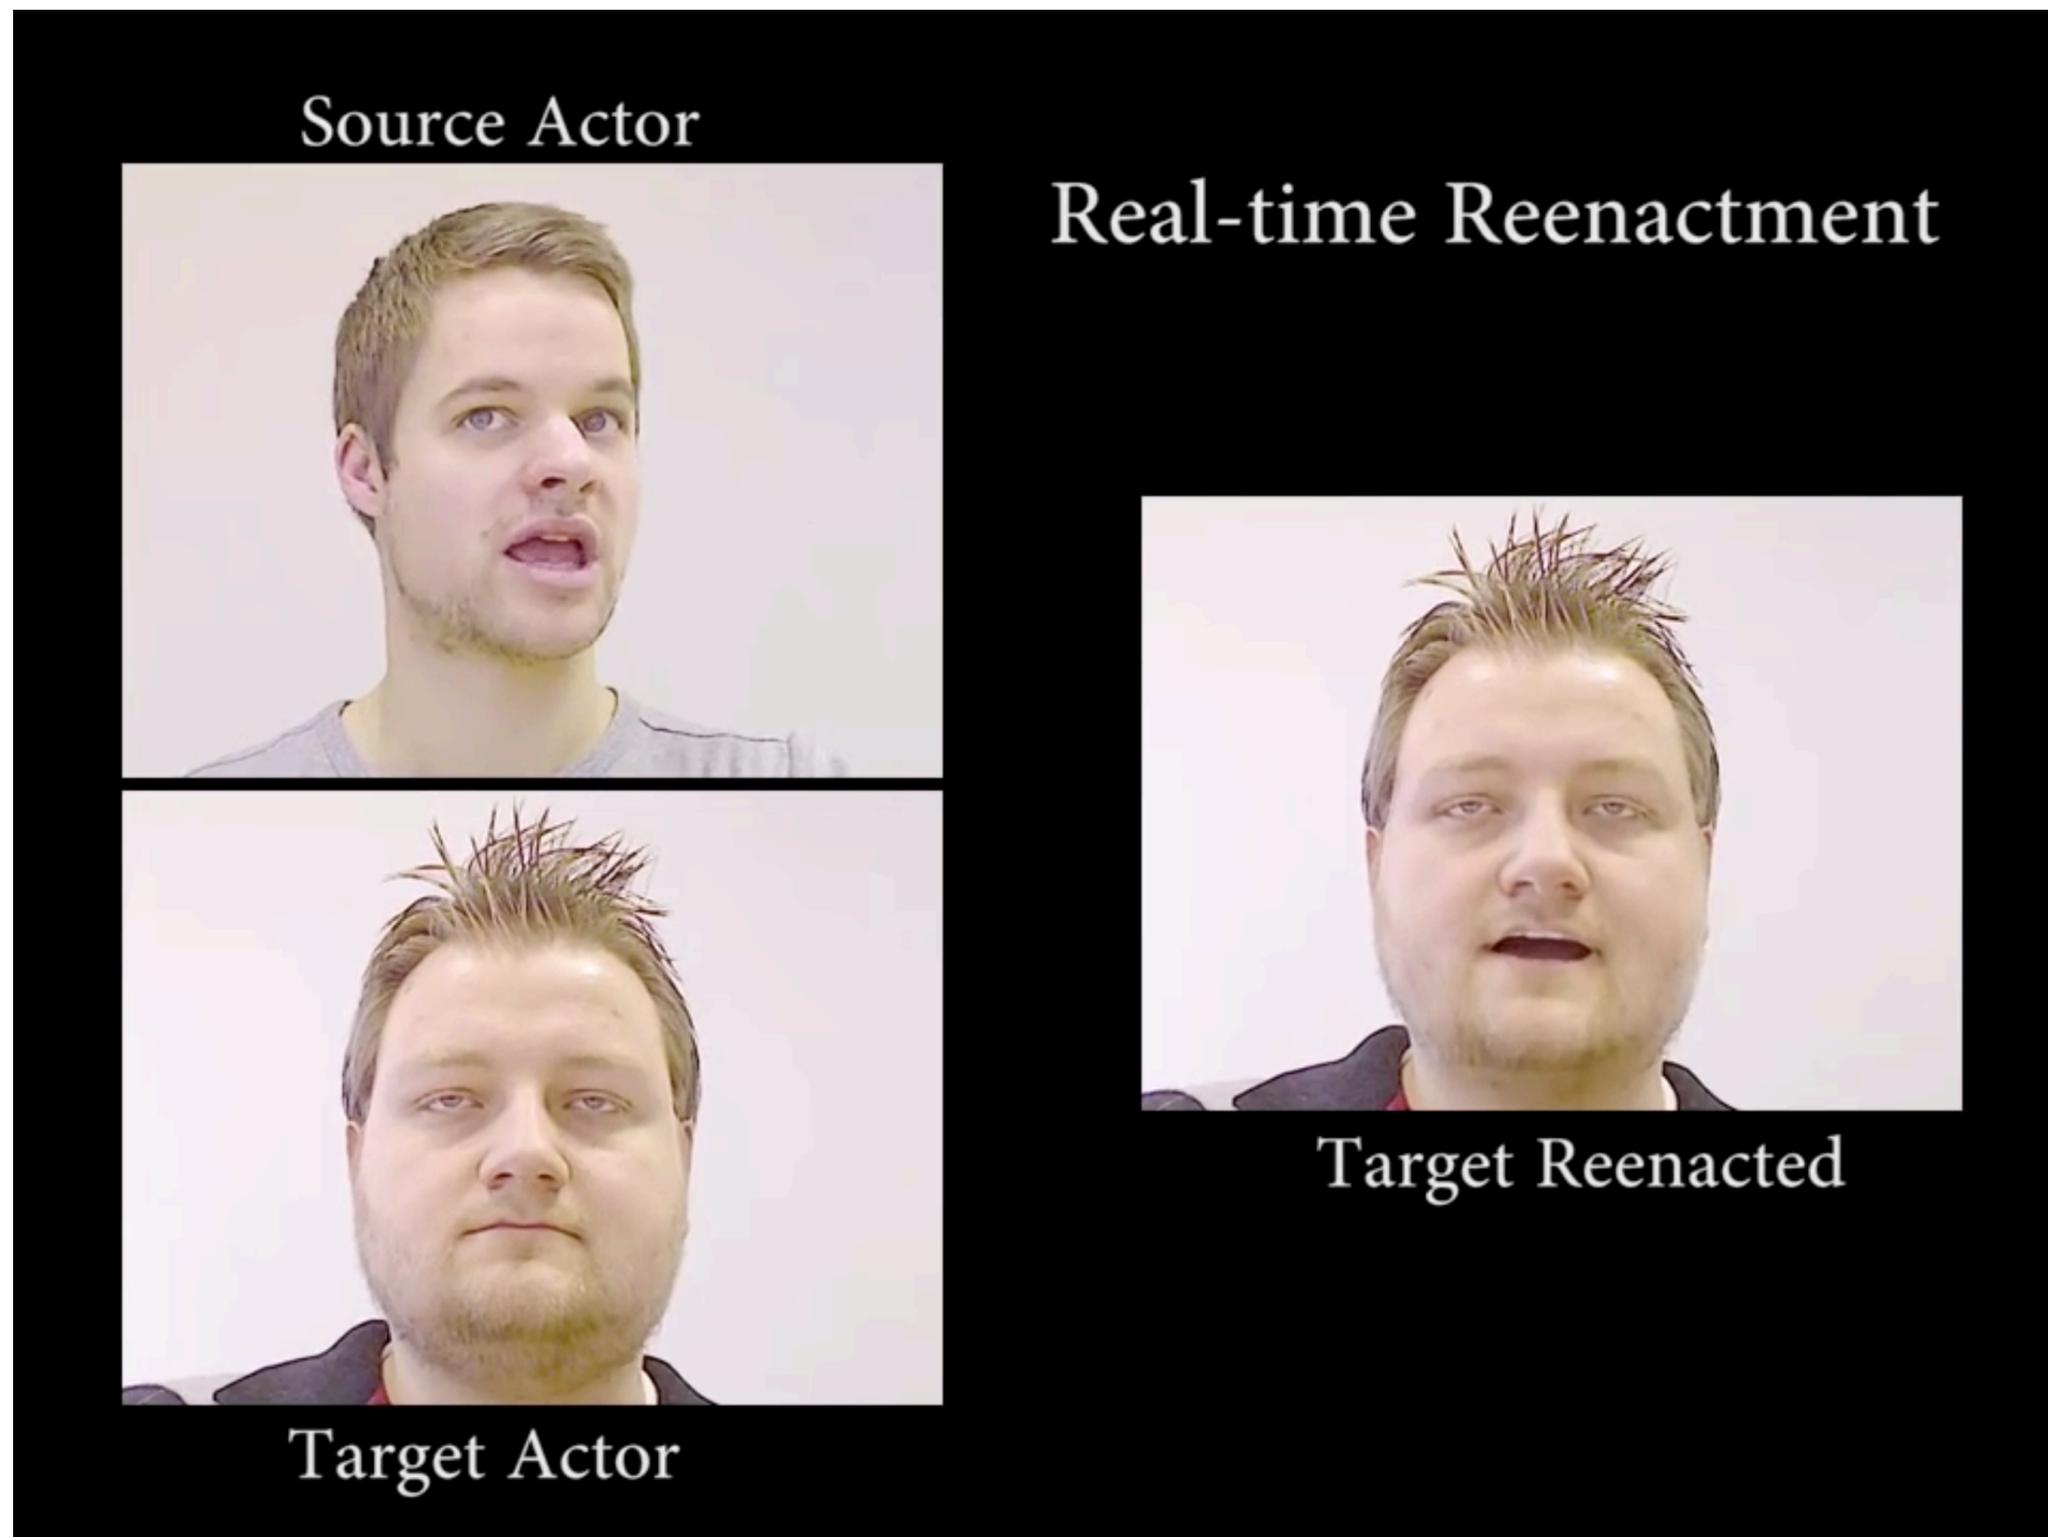

# Example: Image Completion

- Use data to “fill in” missing/undesirable parts of images

# Example: Facial Reenactment

- Map motion from one video to other video (use 3D model)

Thies et al, "Real-Time Expression Transfer for Facial Reenactment" (Transactions on Graphics 2015)

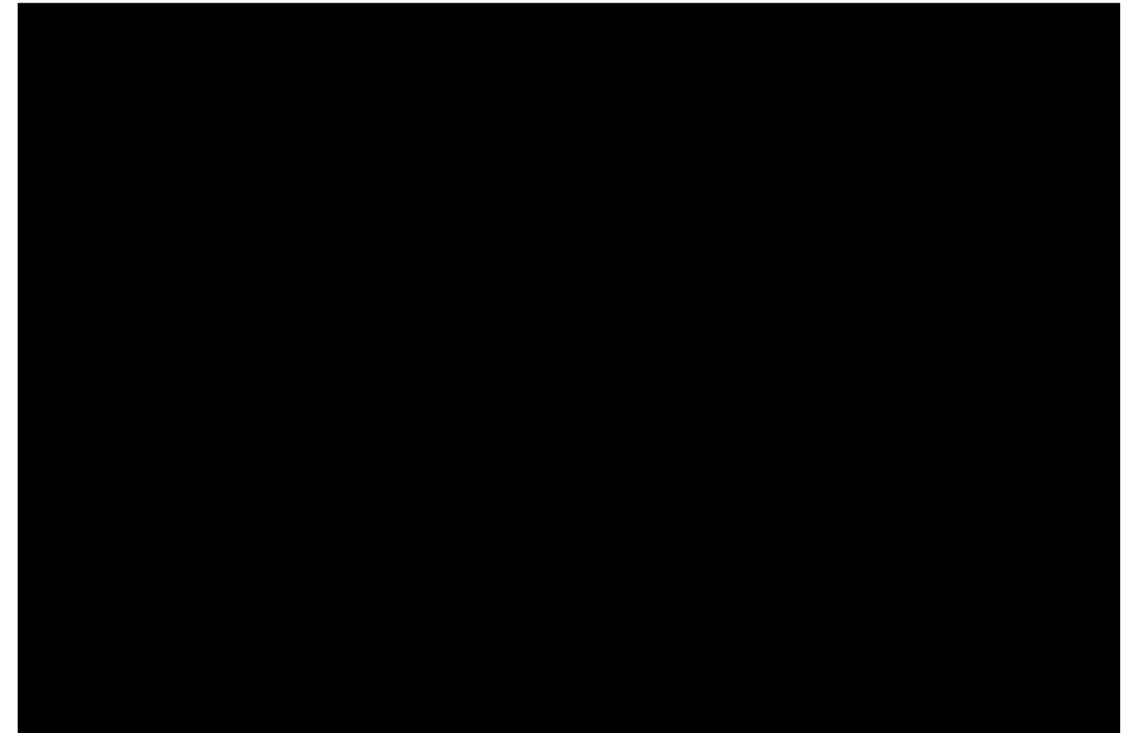

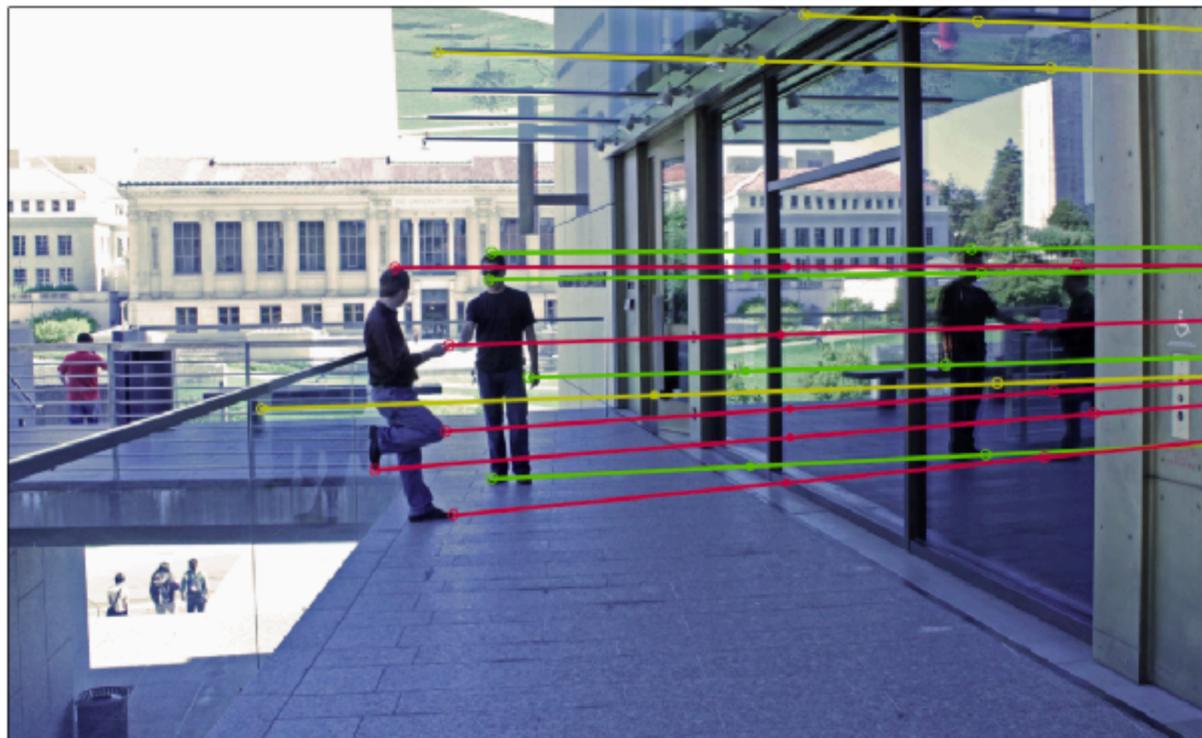

# Ethical Issues?

**THIS FILM HAS BEEN MODIFIED FROM ITS ORIGINAL VERSION. IT HAS BEEN FORMATTED TO FIT THIS SCREEN. AND IT NEVER HAPPENED.**

**<https://www.radiolab.org/story/breaking-news/>**

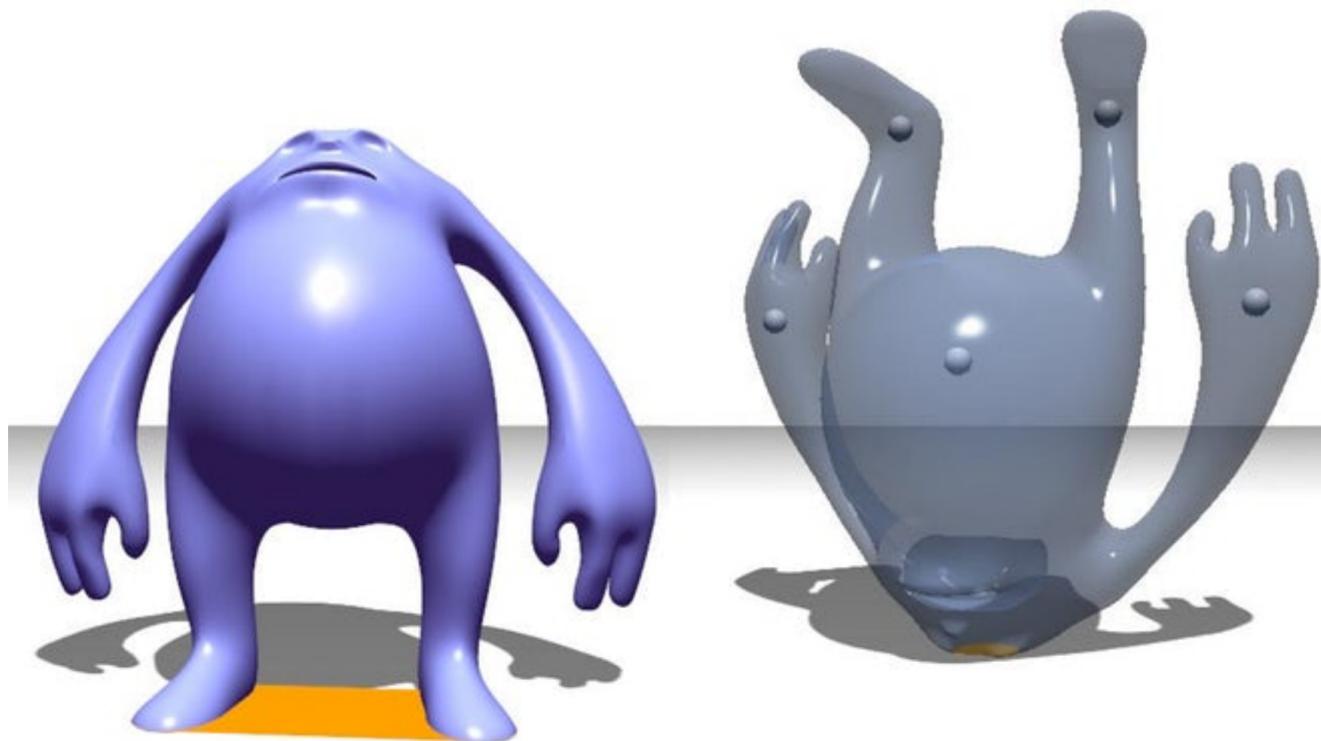

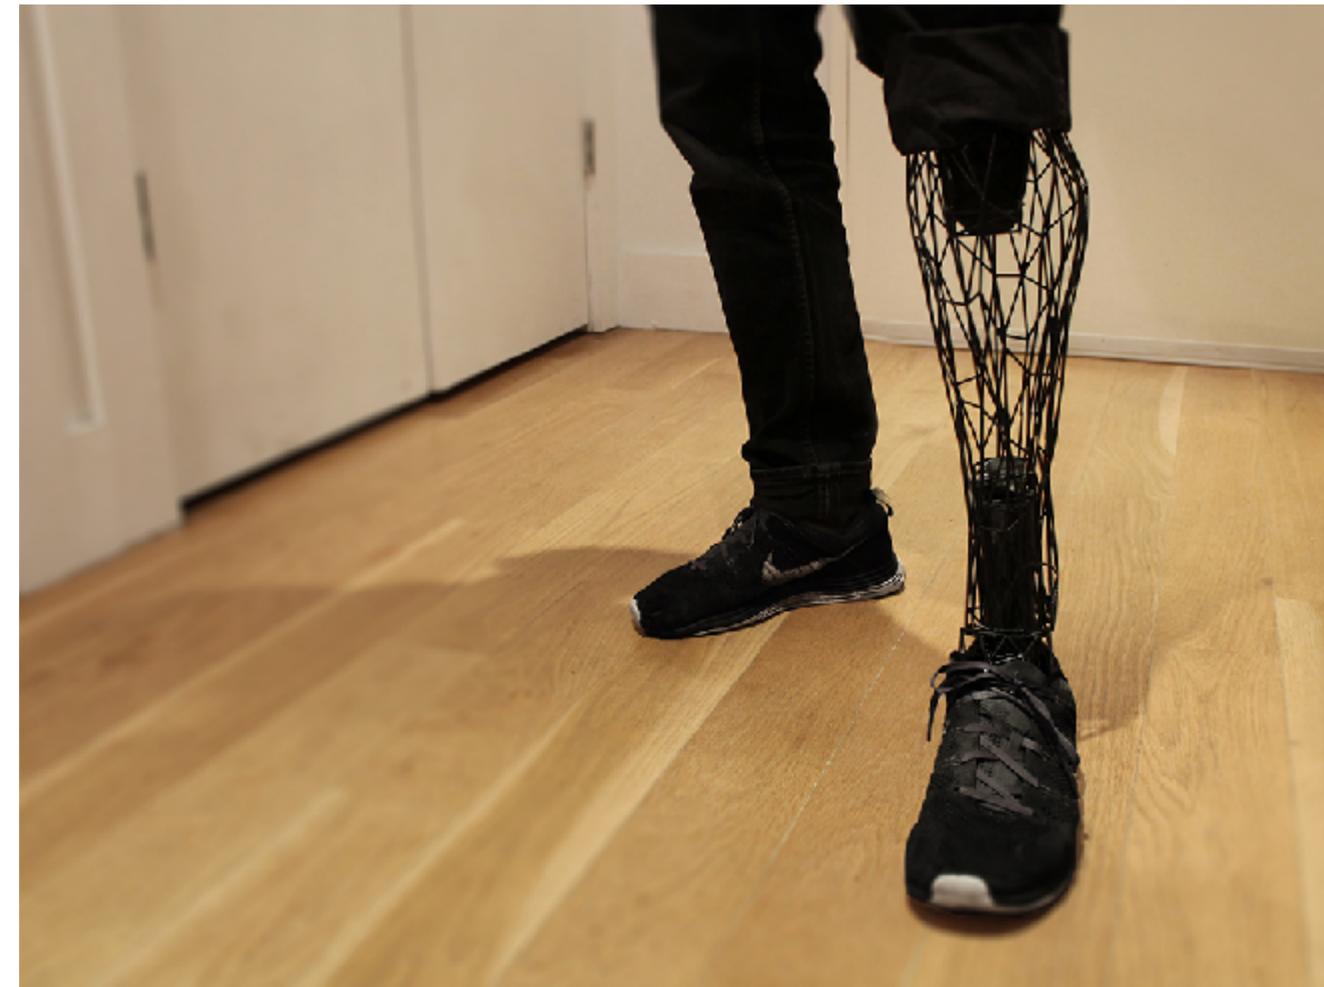

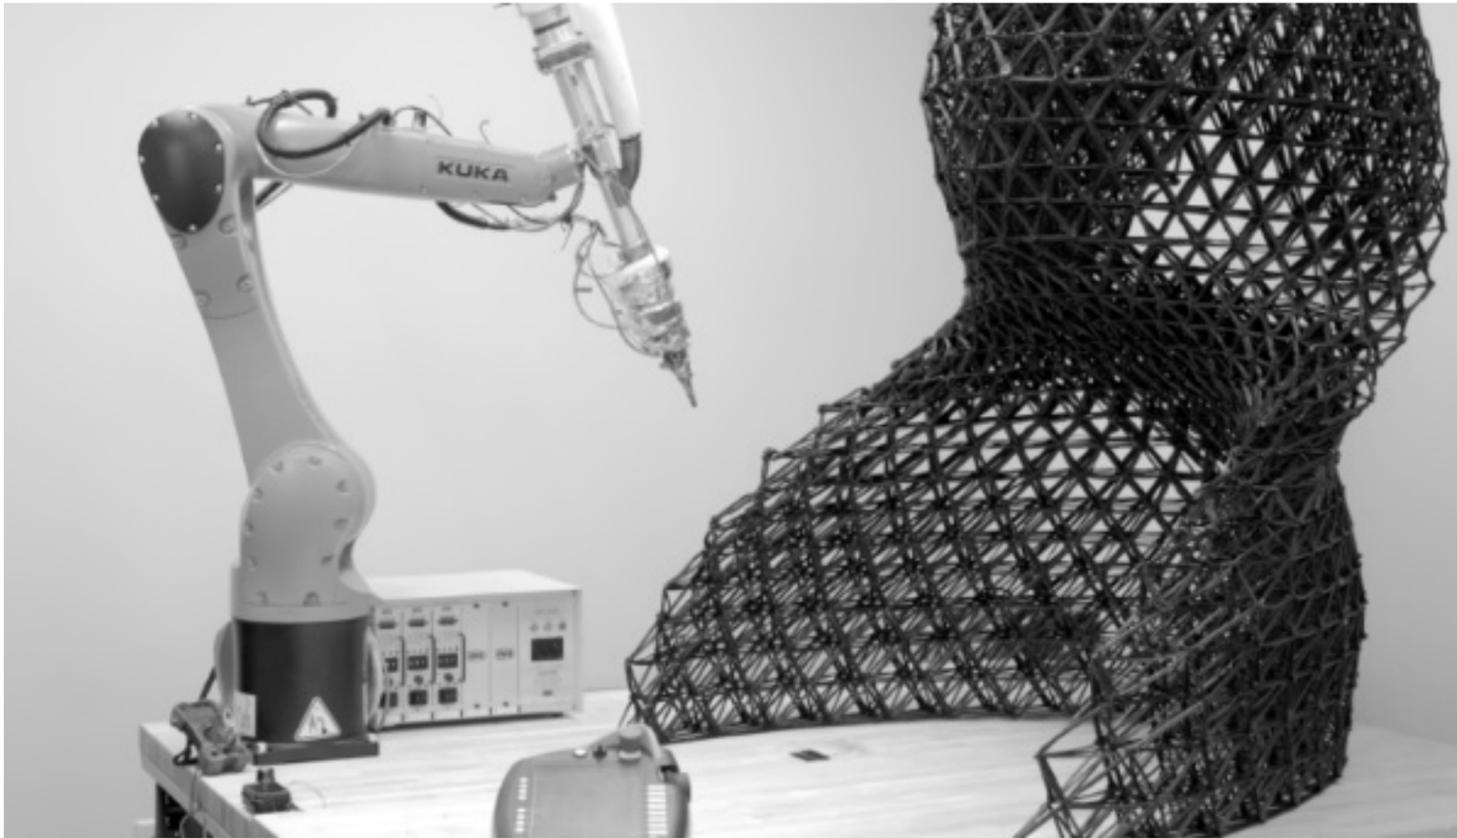

# Digital Forensics

- Also algorithms to *detect* whether a photo is fake!

Kee et al, "Exposing Photo Manipulation with Inconsistent Shadows" (Transactions on Graphics 2013)

# 3D Fabrication

# And much much more!

- Check out SIGGRAPH for latest & greatest graphics stuff
- *You can (start to) understand these papers!*

# Course wrap up

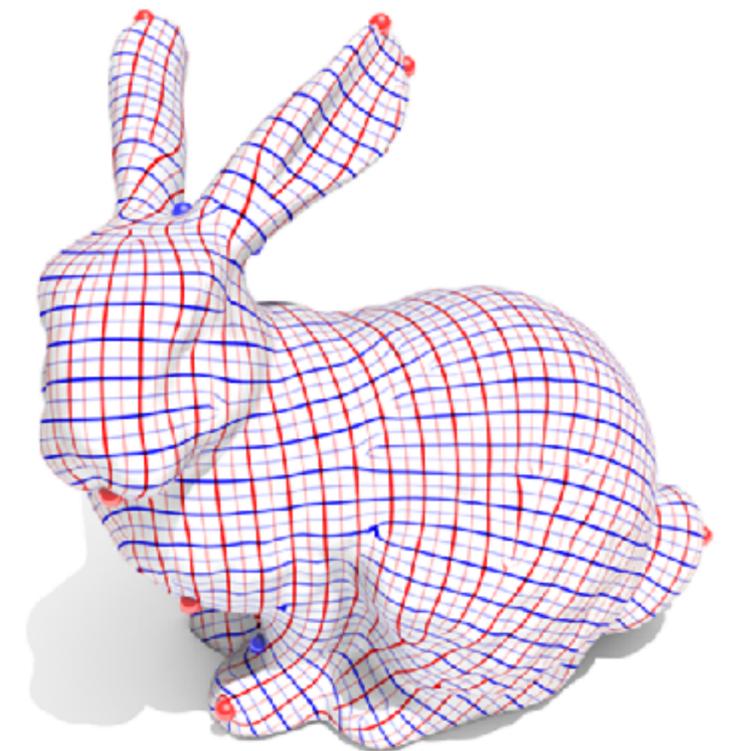

# Final Exam

- **Same format as midterm**
  - **In-class, longer exam**
  - **Can bring one “sticky note” of information**
  - ***Cumulative* (anything in the semester is fair game)**

# Other Cool Graphics-Related Courses (SP'20)

- **Algorithmic Textiles Design 15-469/869**
  - **Jim McCann**
- **Technical Animation 15-464/664**
  - **Nancy Pollard**
- **Hands: Design and Control 16-848**
  - **Nancy Pollard**
- **Animation Art and Technology 15-465/60-414**
  - **Jessica Hodgins, James Duesing**
- **Discrete Differential Geometry 15-458/858**
  - **Keenan Crane**
- **Physics-Based Vision 16-823**
  - **Matthew O'Toole**

# TAs and independent study!

- **15-462 next semester (and next fall) is looking for TAs!**
  - **Email us if interested, and we'll direct you to Prof. Crane**
- **Students that did well in 462 have a great foundation for moving on to independent study or research in graphics**
  - **independent study**
  - **senior thesis**
  - **improve Scotty3D :-)**
  - **...**
  - **Come talk to us / email us**

**Thanks for being a great class!**

**See you at the final! (study hard, but don't stress too much)**
