Introduction to Animation

Computer Graphics CMU 15-462/15-662

Increasing the complexity of our modelsTransformationsGeometryMaterials, lighting, ...

Increasing the complexity of our models ...but what about motion?

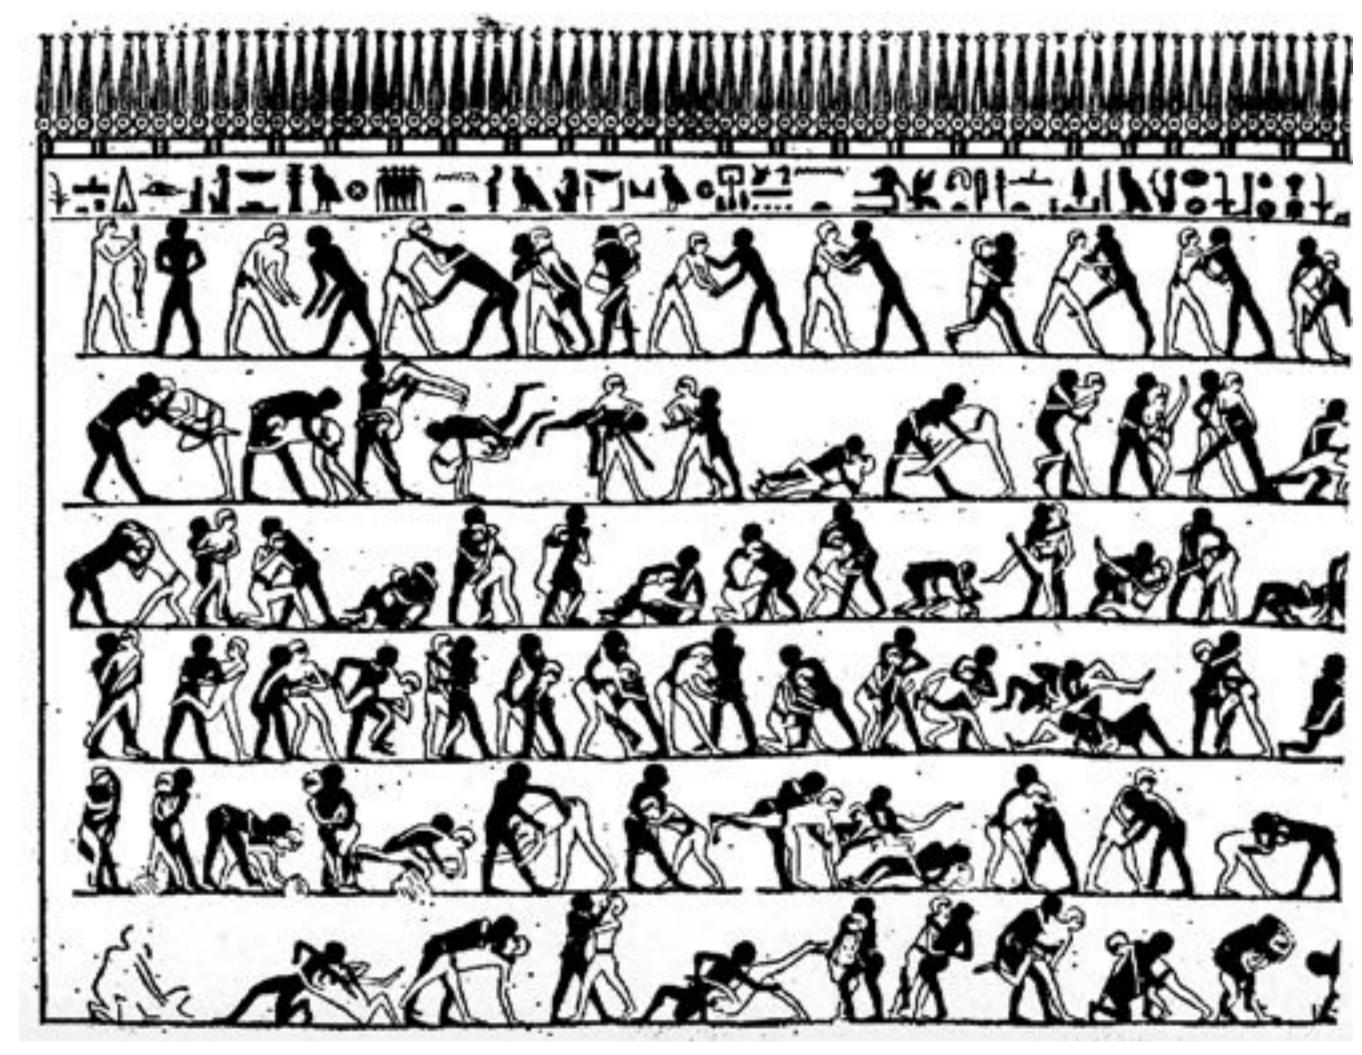

First Animation

(Shahr-e Sukhteh, Iran 3200 BCE)

(tomb of Khnumhotep, Egypt 2400 BCE)

Leonardo da Vinci (1510)

and and and and and a second a sping and a murat multiple of the second dear wet on the alt of

Claude Monet, "Woman with a Parasol" (1875)

(Phenakistoscope, 1831)

First Film

Originally used as scientific tool rather than for entertainment Critical technology that accelerated development of animation

Eadweard Muybridge, "Sallie Gardner" (1878)

First Animation on Film

Emile Cohl, "Fantasmagorie" (1908)

First Feature-Length Animation

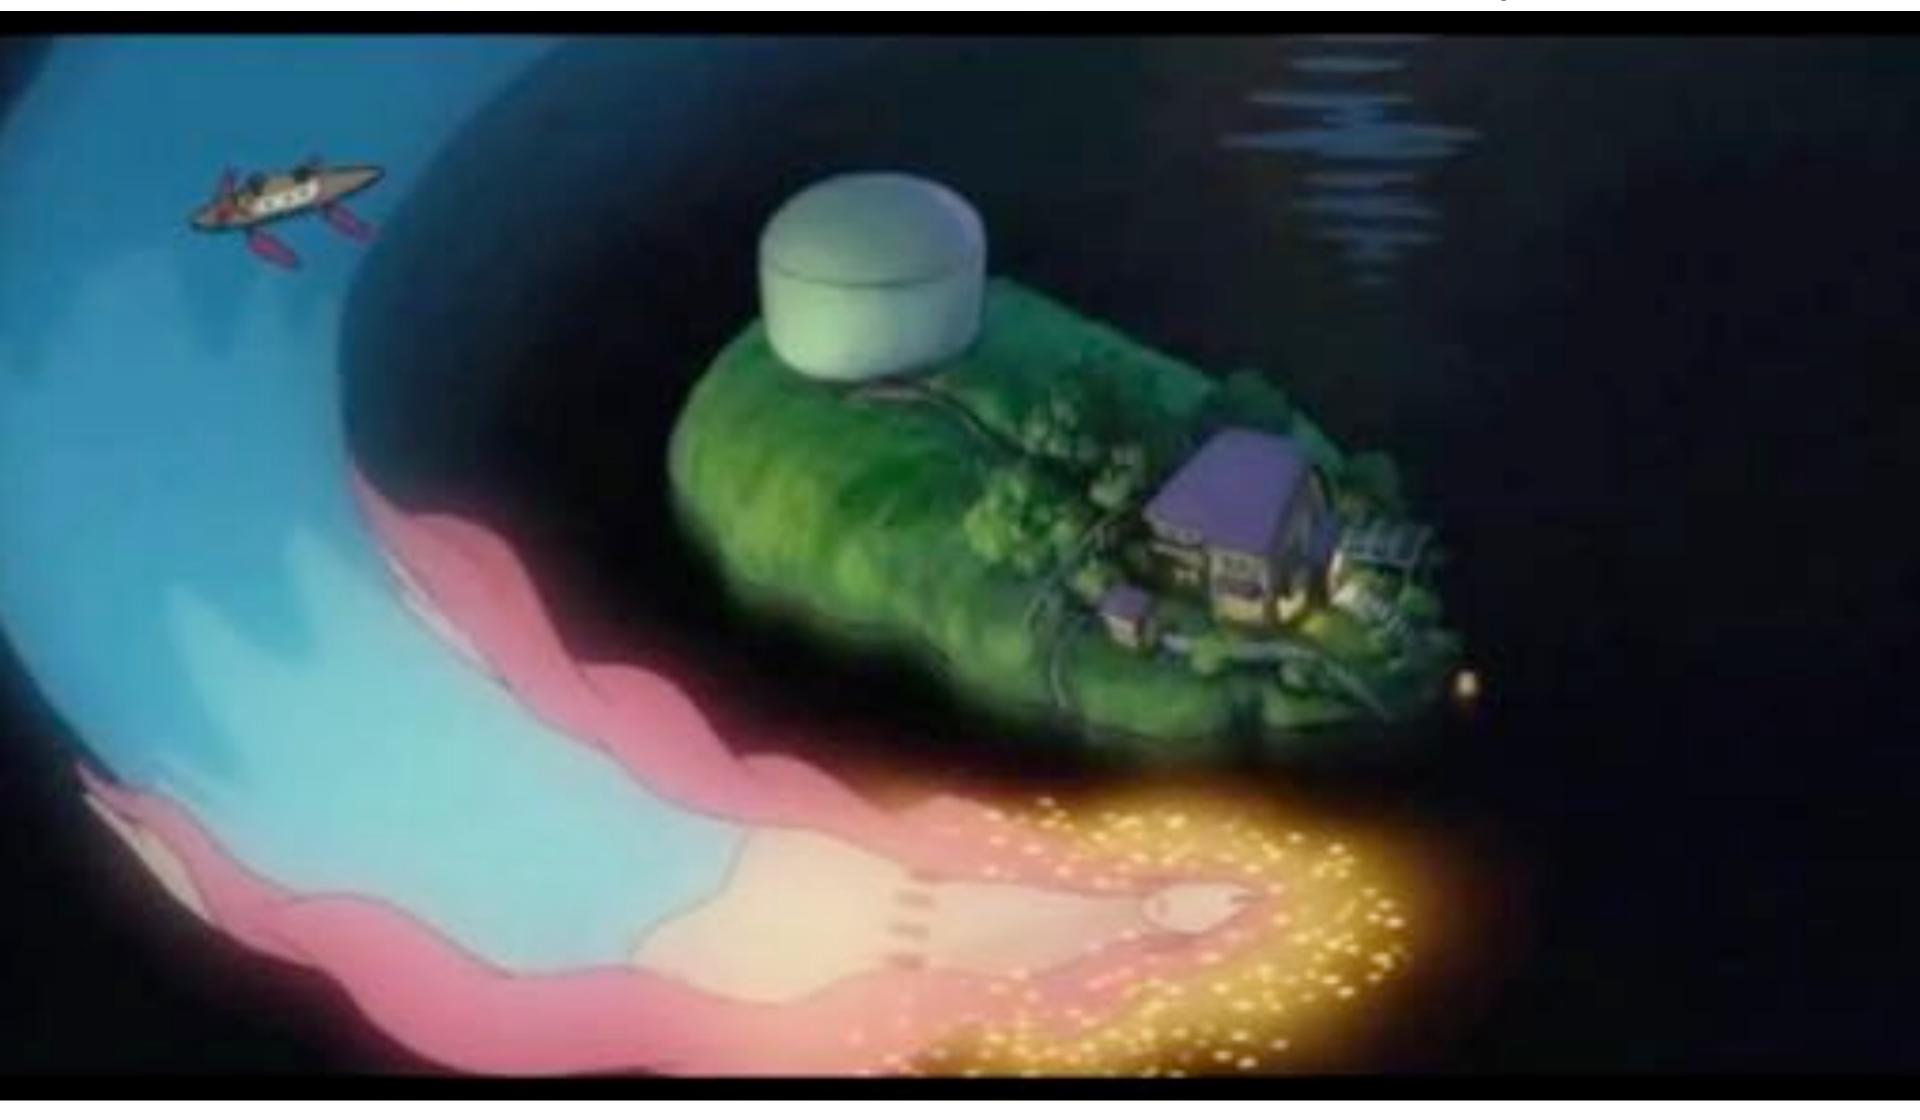

Lotte Reiniger, "Die Abenteuer des Prinzen Achmed" (1926)

First Hand-Drawn Feature-Length Animation

Disney, "Snow White and the Seven Dwarves" (1937)

Hand-Drawn Animation - Present Day

Studio Ghibli, "Ponyo" (2008)

First Computer-Generated Animation

- New technology, also developed as a scientific tool
- Again turbo-charged the development of animation

John Whitney, "Catalog" (1961)

imationentific tool of animation

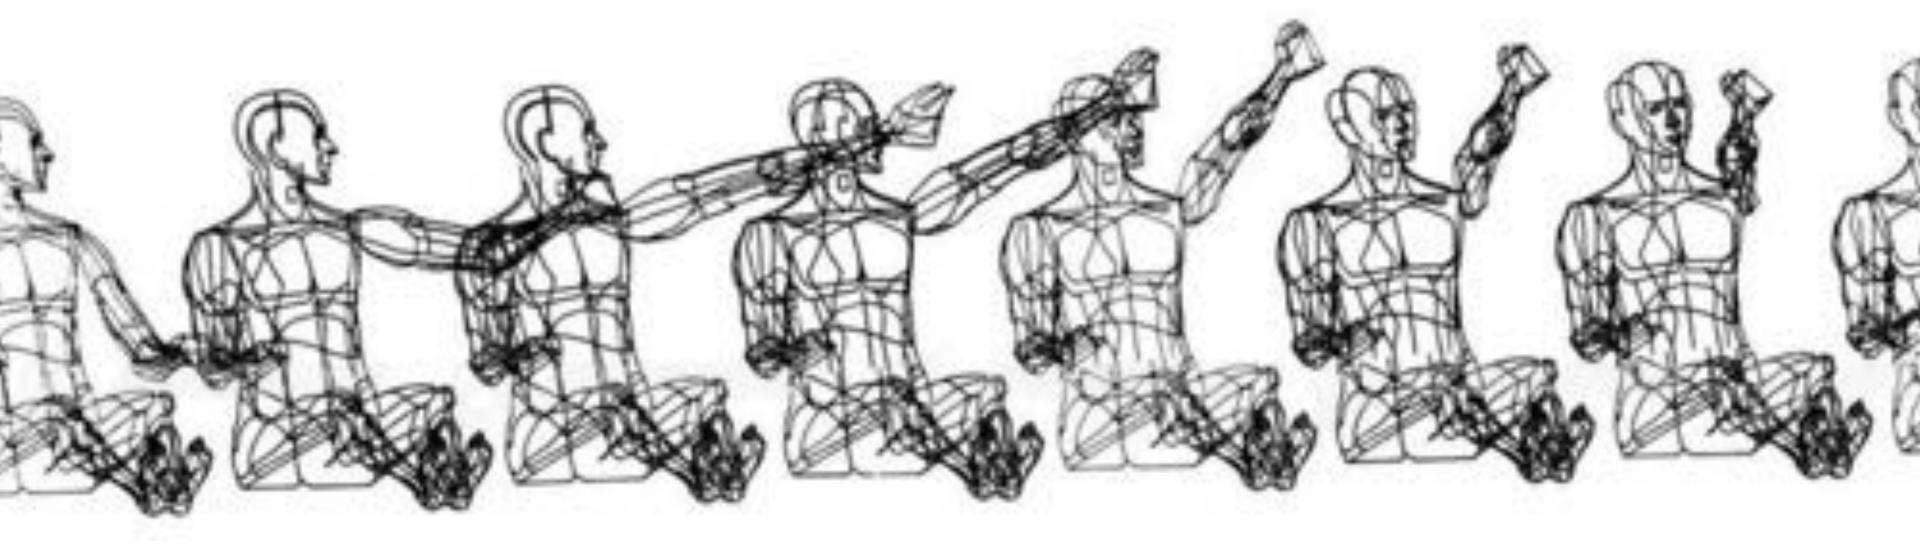

First Digital-Computer-Generated Animation

Ivan Sutherland, "Sketchpad" (1963)

First 3D Computer Animation

William Fetter, "Boeing Man" (1964)

Early Computer Animation

Nikolay Konstantinov, "Kitty" (1968)

Early Computer Animation

Ed Catmull & Fred Park, "Computer Animated Faces" (1972)

First Attempted CG Feature Film

NYIT [Williams, Heckbert, Catmull, ...], "The Works" (1984)

First CG Feature Film

Pixar, "Toy Story" (1995)

Computer Animation - Present Day

MOVIECLIPS.COM

Sony Pictures Animation, "Cloudy With a Chance of Meatballs" (2009)

Zoetrope - 3D Printed Animation

Perception of Motion

- **Original (but debunked) theory: persistence of vision ("streaking")**
- The eye is not a camera! More modern explanation:
 - beta phenomenon: visual memory in brain—not eyeball
 - phi phenomenon: brain anticipates, giving sense of motion

Depiction of Motion

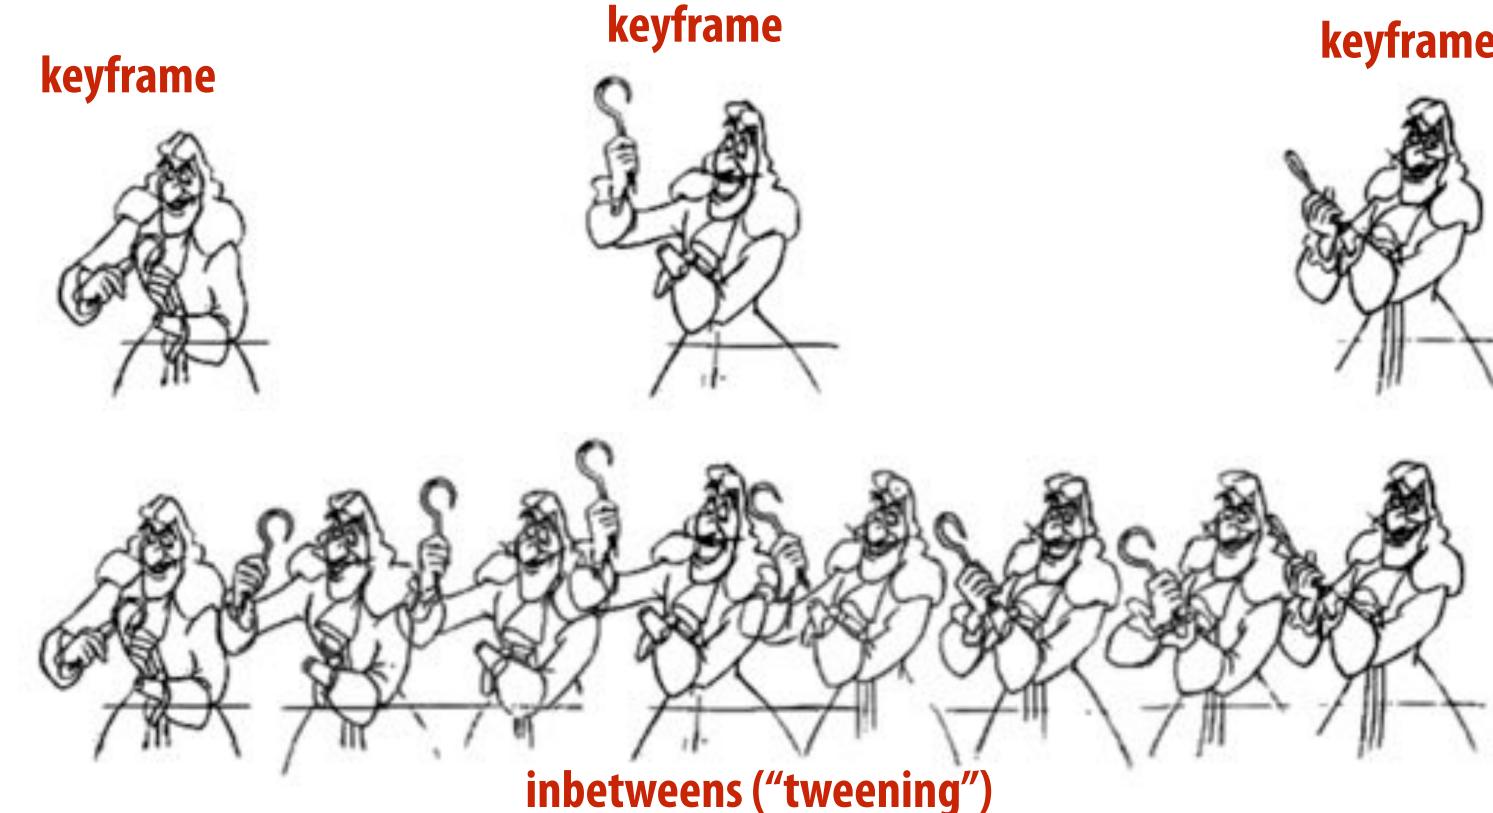

beta (Muybridge, 1887)

phi (Duchamp, 1912)

Generating Motion (Hand-Drawn)

- Senior artist draws keyframes
- **Assistant draws inbetweens**
- **Tedious / labor intensive (opportunity for technology!)**

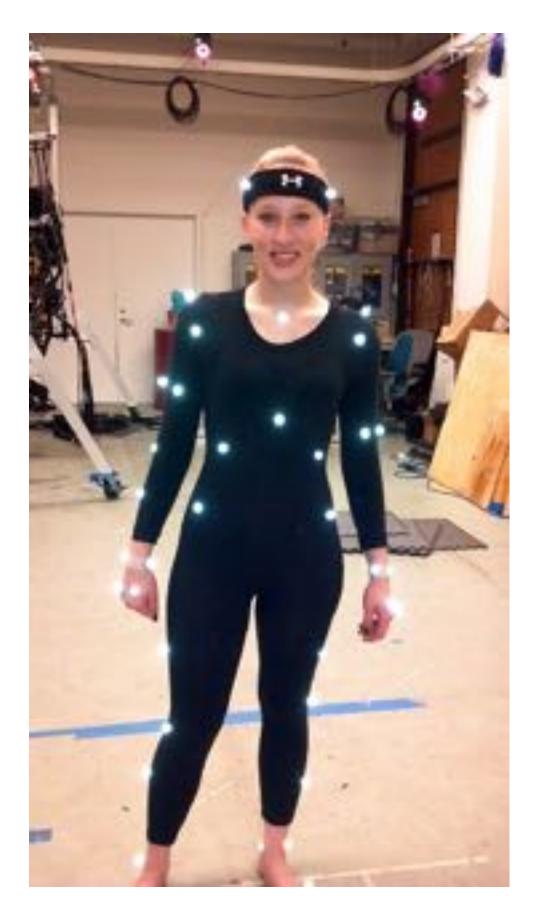

keyframe

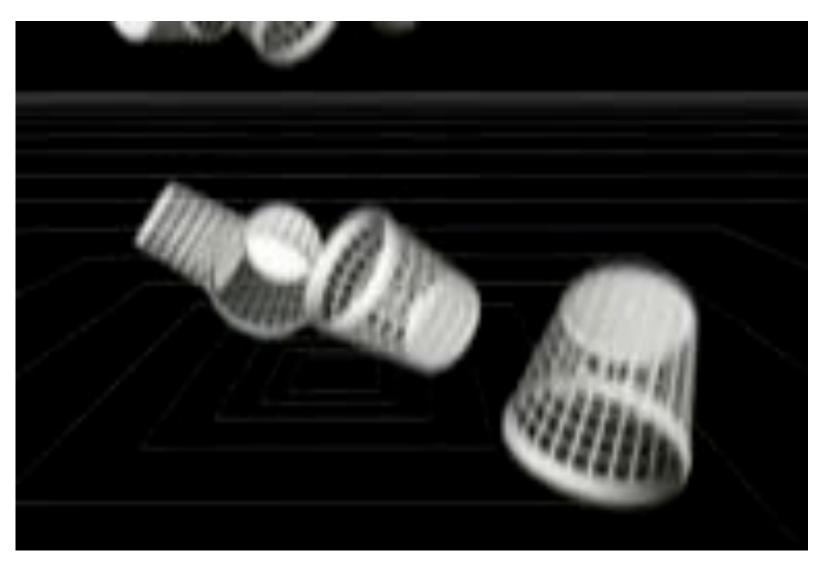

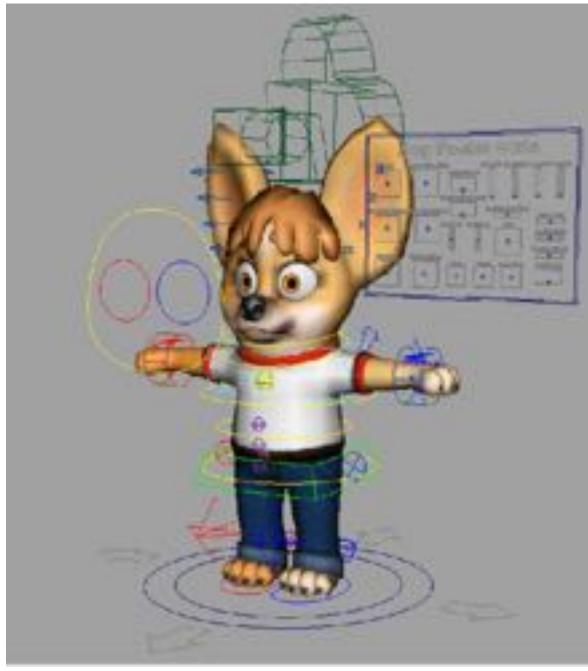

How do we describe motion on a computer?

Basic Techniques in Computer Animation

- Artist-directed (e.g., keyframing)
- Data-driven (e.g., motion capture)
 Procedural (e.g., simulation)

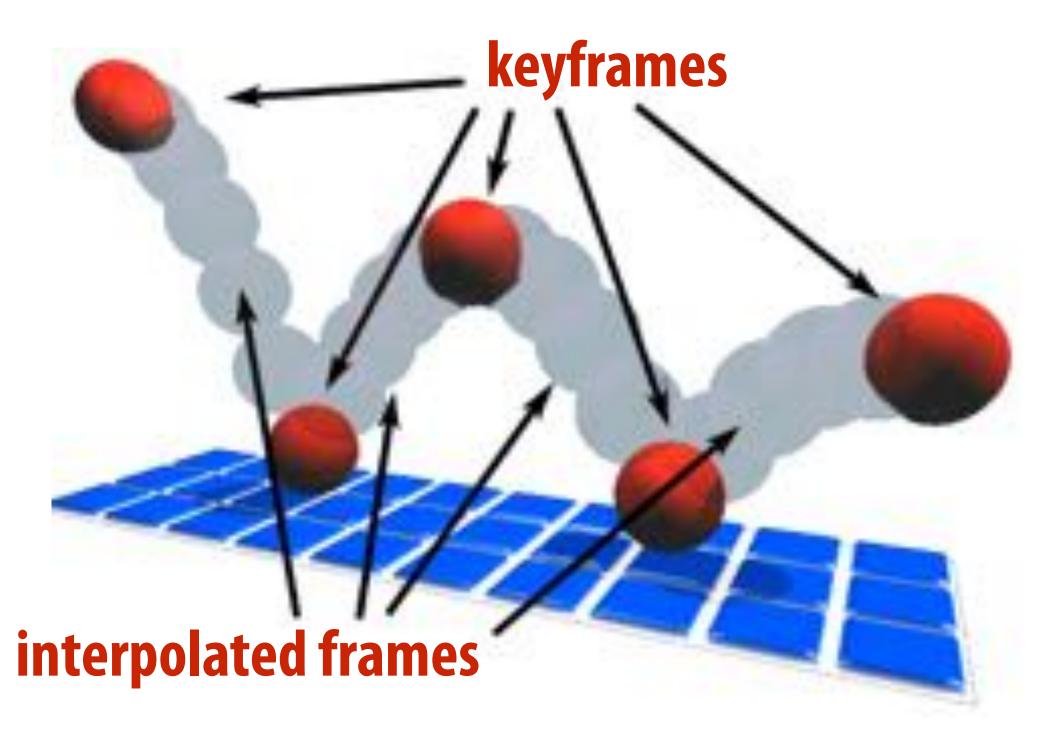

Keyframing

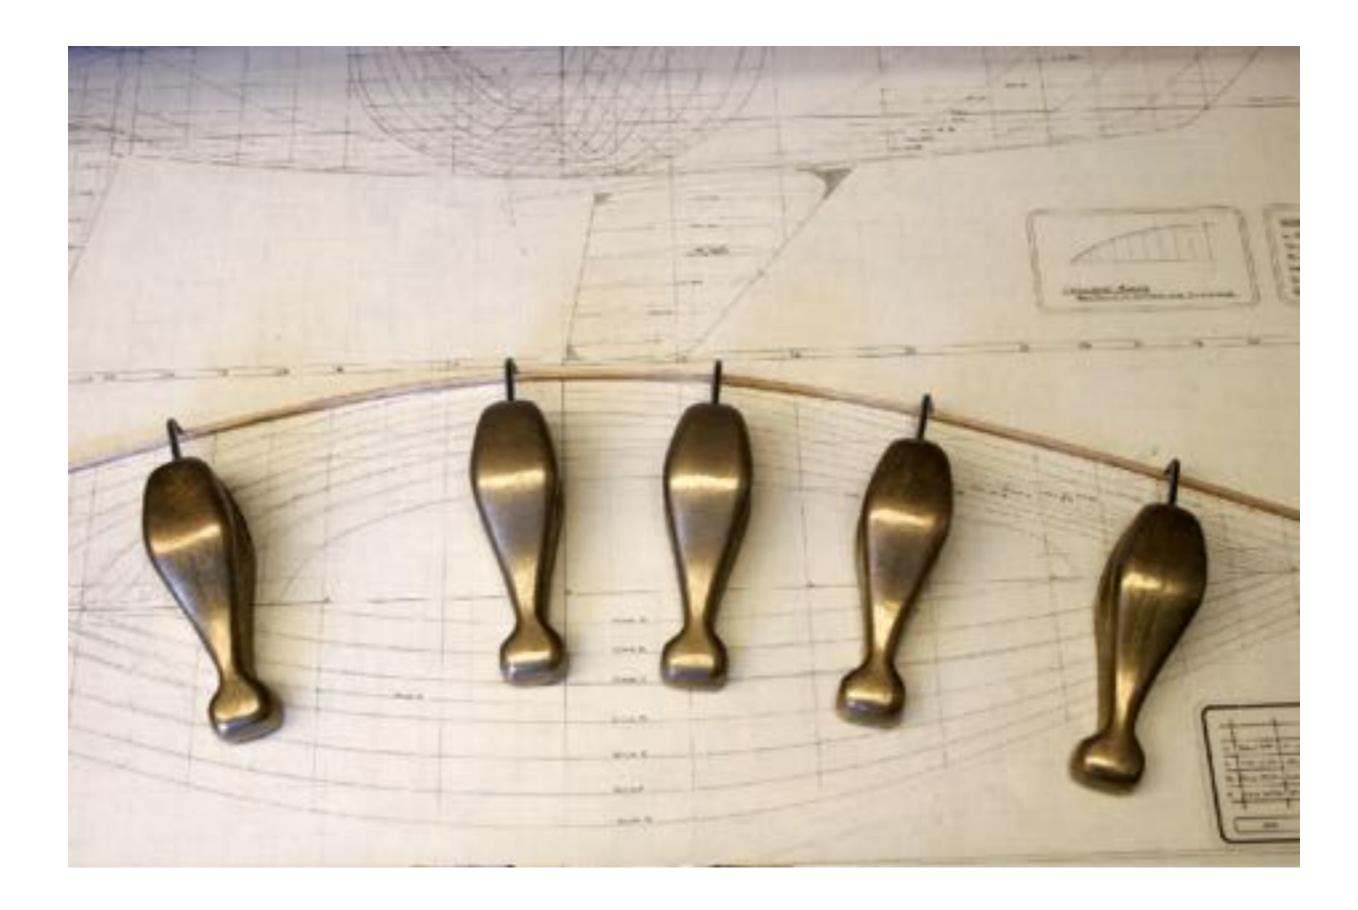

- **Basic idea:**
 - specify important events only
 - computer fills in the rest via interpolation/approximation
 - "Events" don't have to be position
- Could be color, light intensity, camera zoom, ...

How do you interpolate data?

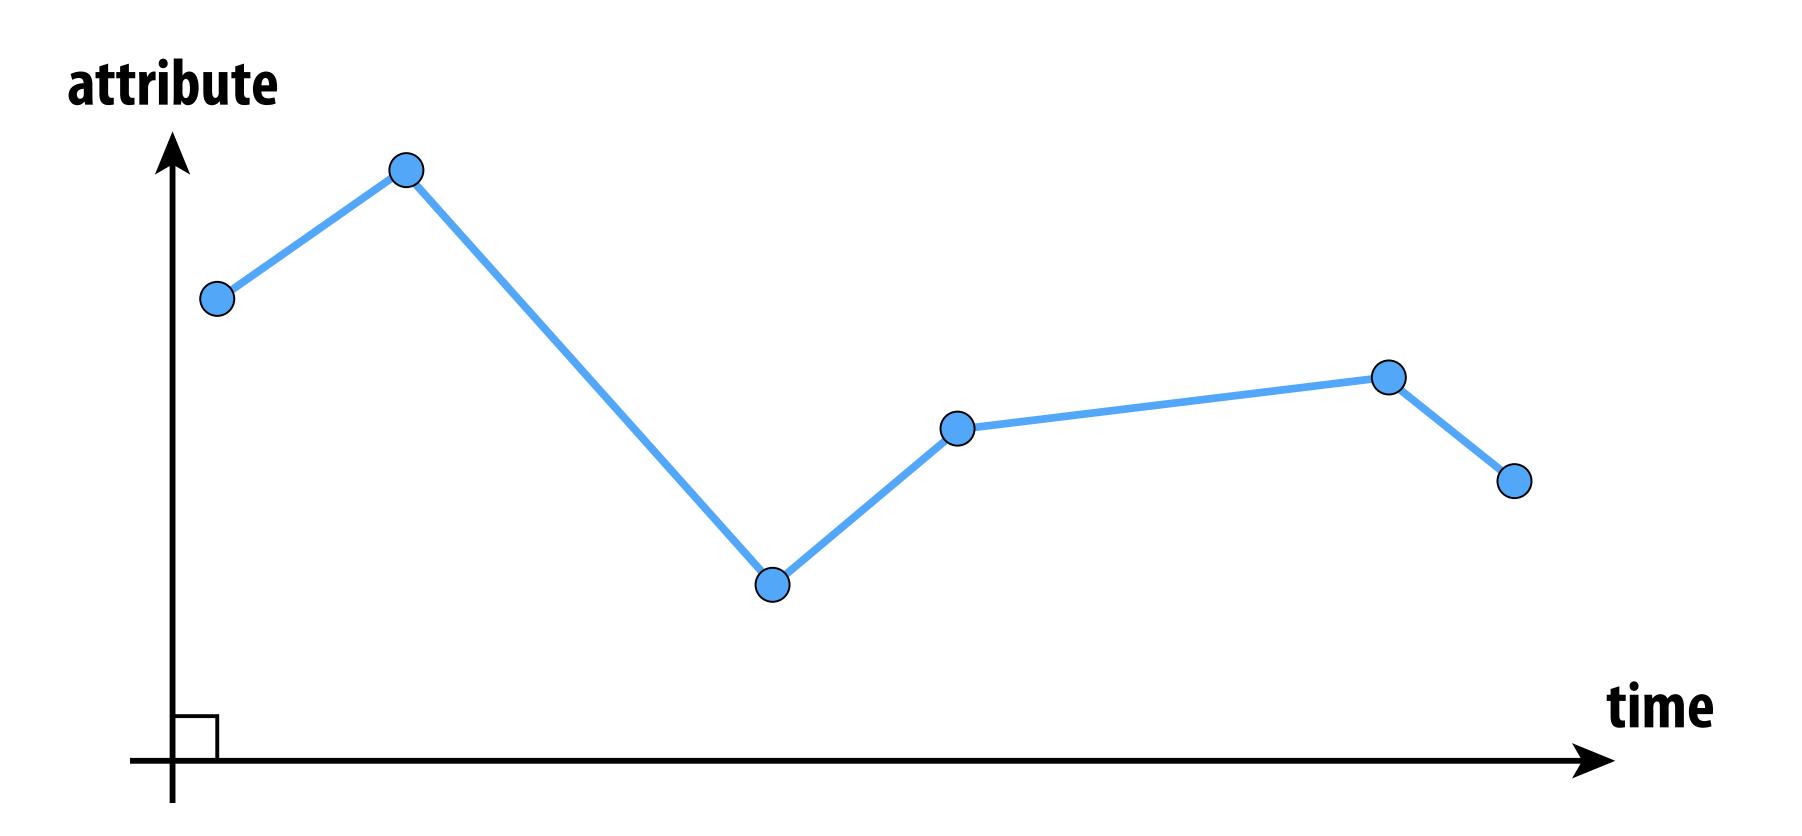

Spline Interpolation

- Mathematical theory of interpolation arose from study of thin strips of wood or metal ("splines") under various forces
- Good summary in Levin, "The Elastica: A Mathematical History"

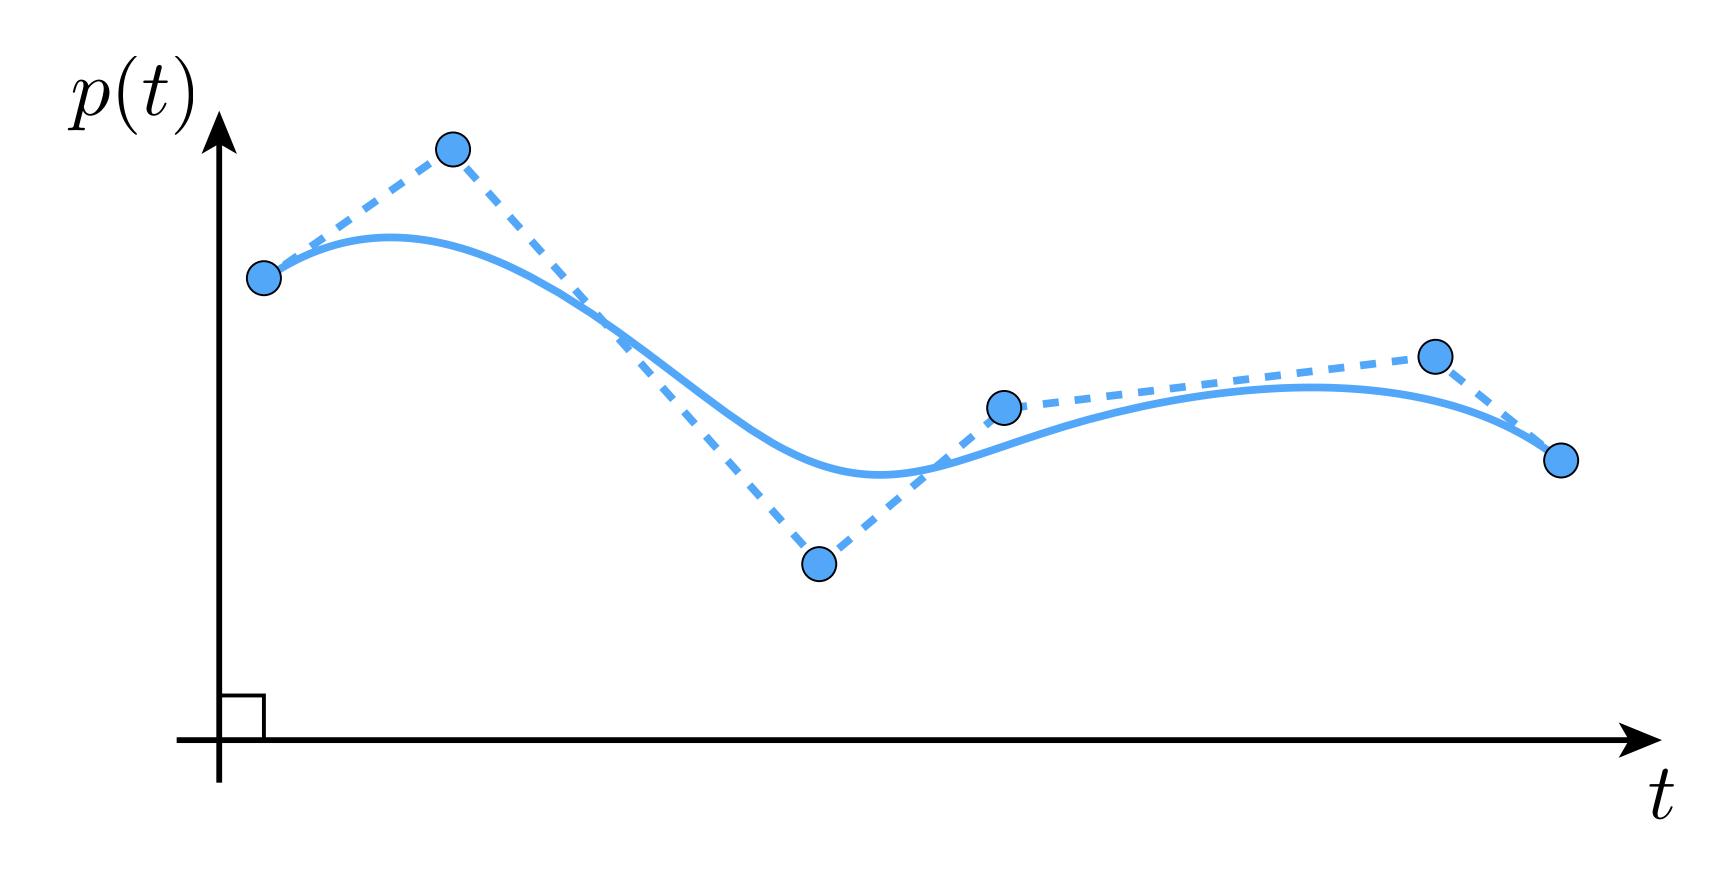

Interpolation

- **Basic idea:** "connect the dots"
- E.g., piecewise linear interpolation
- Simple, but yields rather rough motion (infinite acceleration)

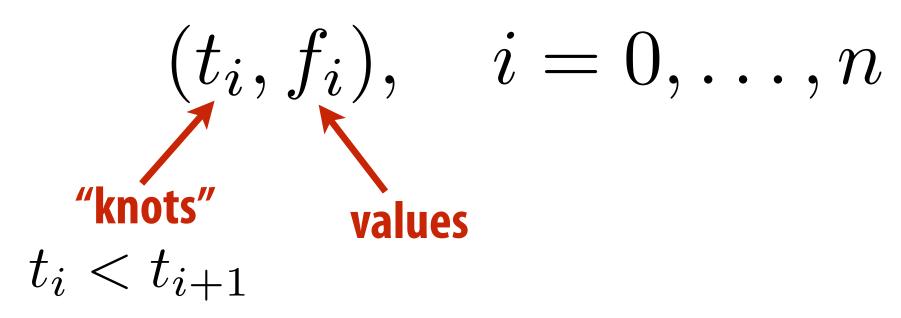

Piecewise Polynomial Interpolation Common interpolant: piecewise polynomial "spline"

Basic motivation: get better continuity than piecewise linear!

Splines

- In general, a spline is any piecewise polynomial function
- In 1D, spline interpolates data over the real line:

"Interpolates" just means that the function exactly passes through those values:

$$f(t_i) = f_i \quad \forall$$

The only other condition is that the function is a polynomial when restricted to any interval between knots:

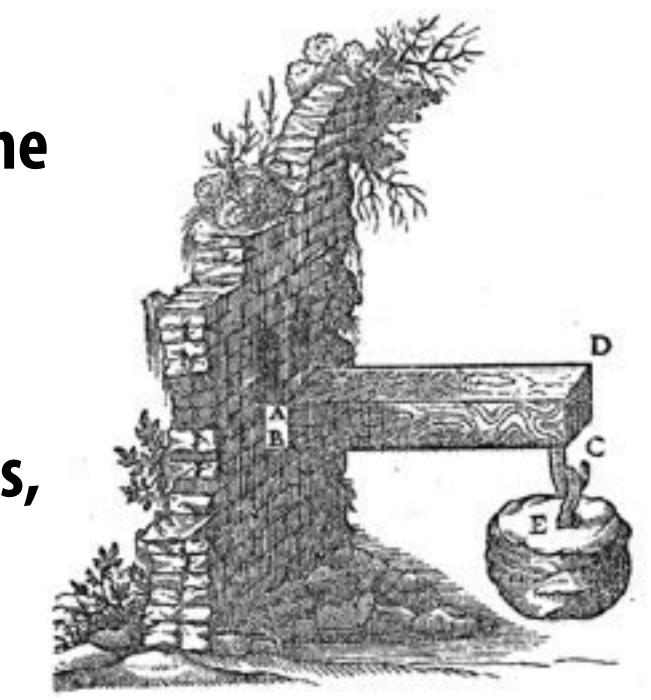

for
$$t_i \le t \le t_{i+1}, f(t) = \sum_{j=1}^{d}$$

coefficient

$\forall i$ polynomial $\sum_{j=1}^{d} c_i t^j =: p_i(t)$

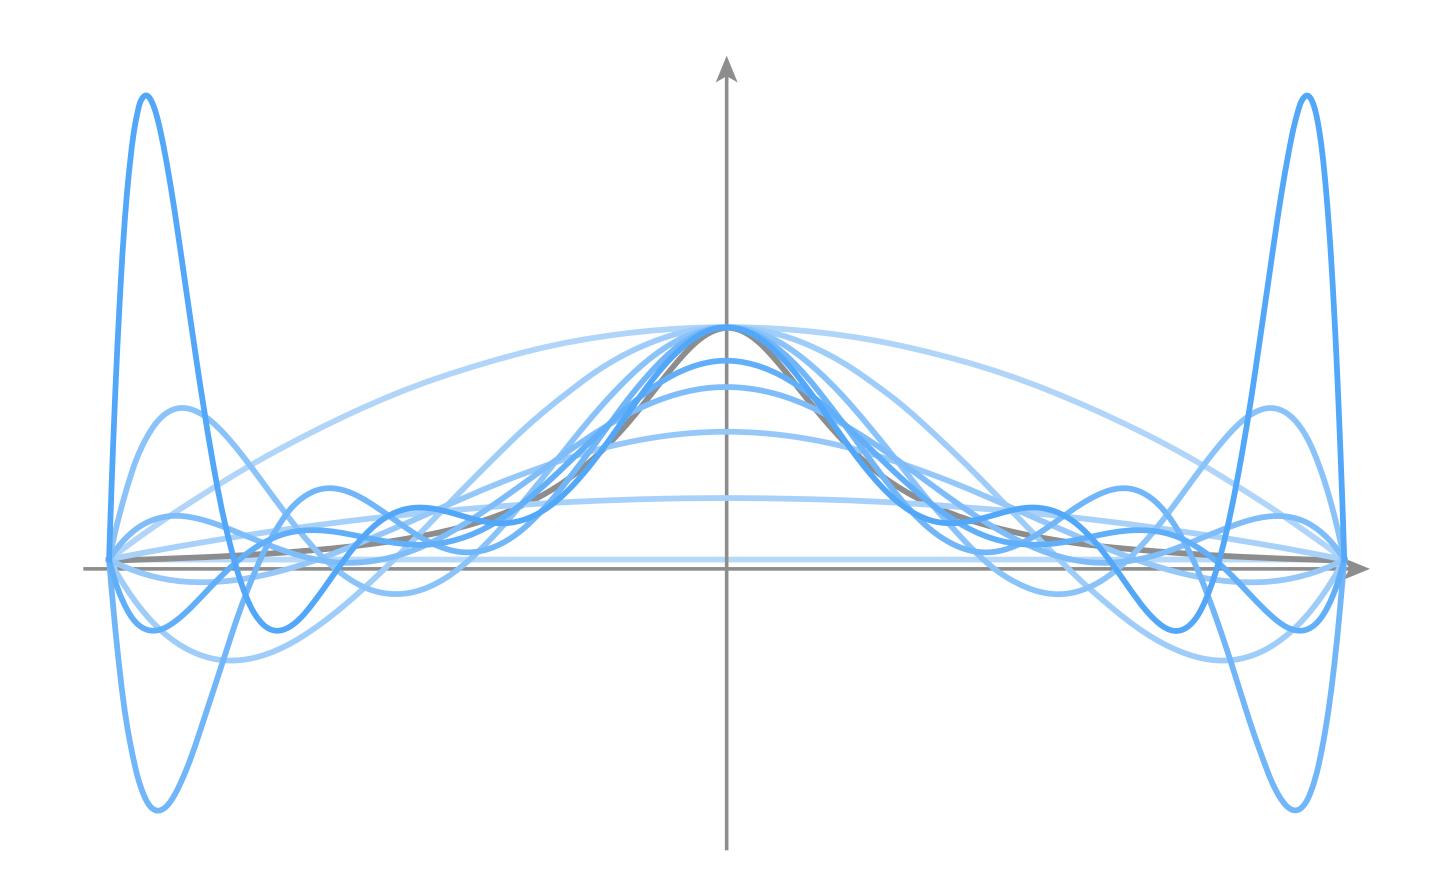

What's so special about cubic polynomials?

- Splines most commonly used for interpolation are cubic (d=3)
- Schoenberg: piecewise cubics give exact solution to elastic spline problem under assumption of small displacements
- More precisely: among all curves interpolating set of data points, minimizes norm of second derivative (not curvature)
- Food for thought: who cares about physical splines? We're on a computer! And are interpolating phenomena in time
- Motivation is perhaps pragmatic: e.g., simple closed form, decent continuity
- Plenty of good reasons to choose alternatives (e.g., NURBS for exact conics, clothoid to prevent jerky motion, ...)
- Also...

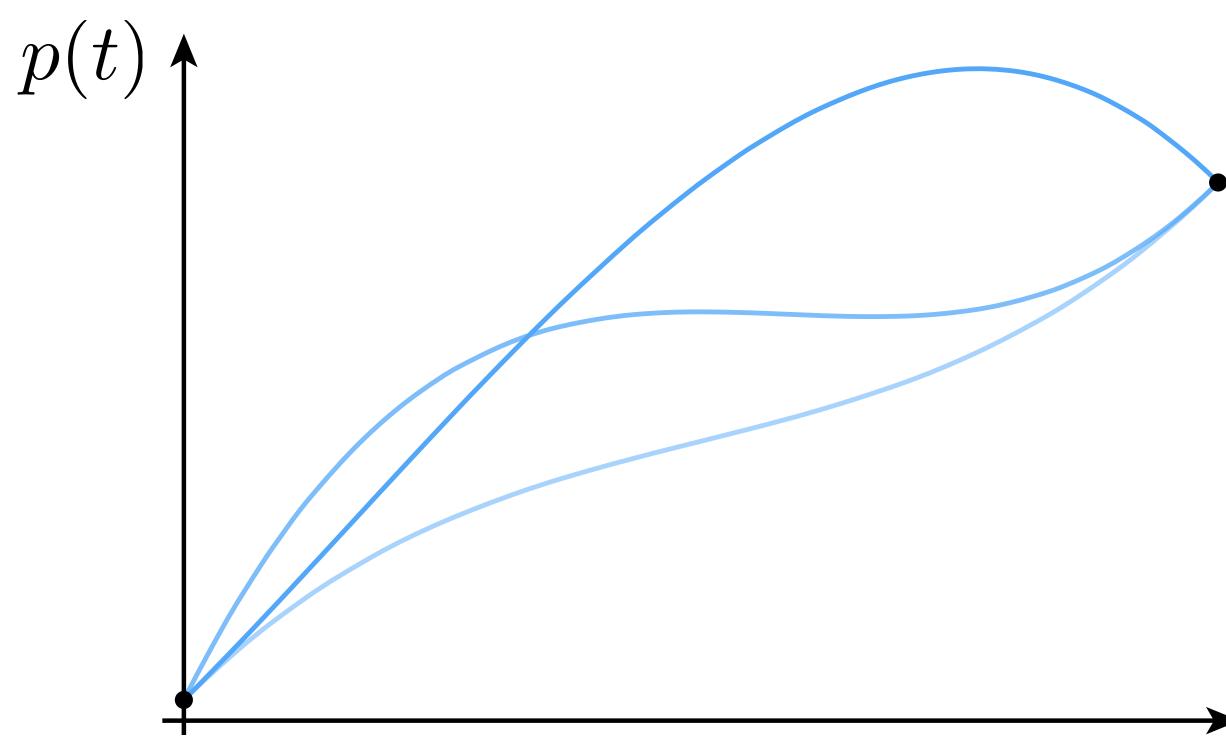

Runge Phenomenon

- Tempting to use higher-degree polynomials, in order to get higher-order continuity
- Can lead to oscillation, ultimately worse approximation:

Fitting a Cubic Polynomial to Endpoints

- Consider a single cubic polynomial $p(t) = at^3 + bt^2 + ct + d$
 - Suppose we want it to match given endpoints:

Many solutions!

ct + d

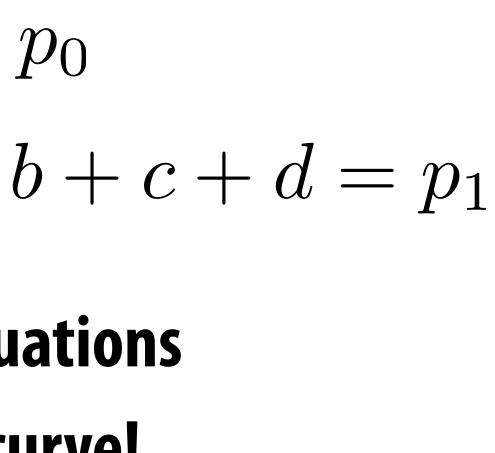

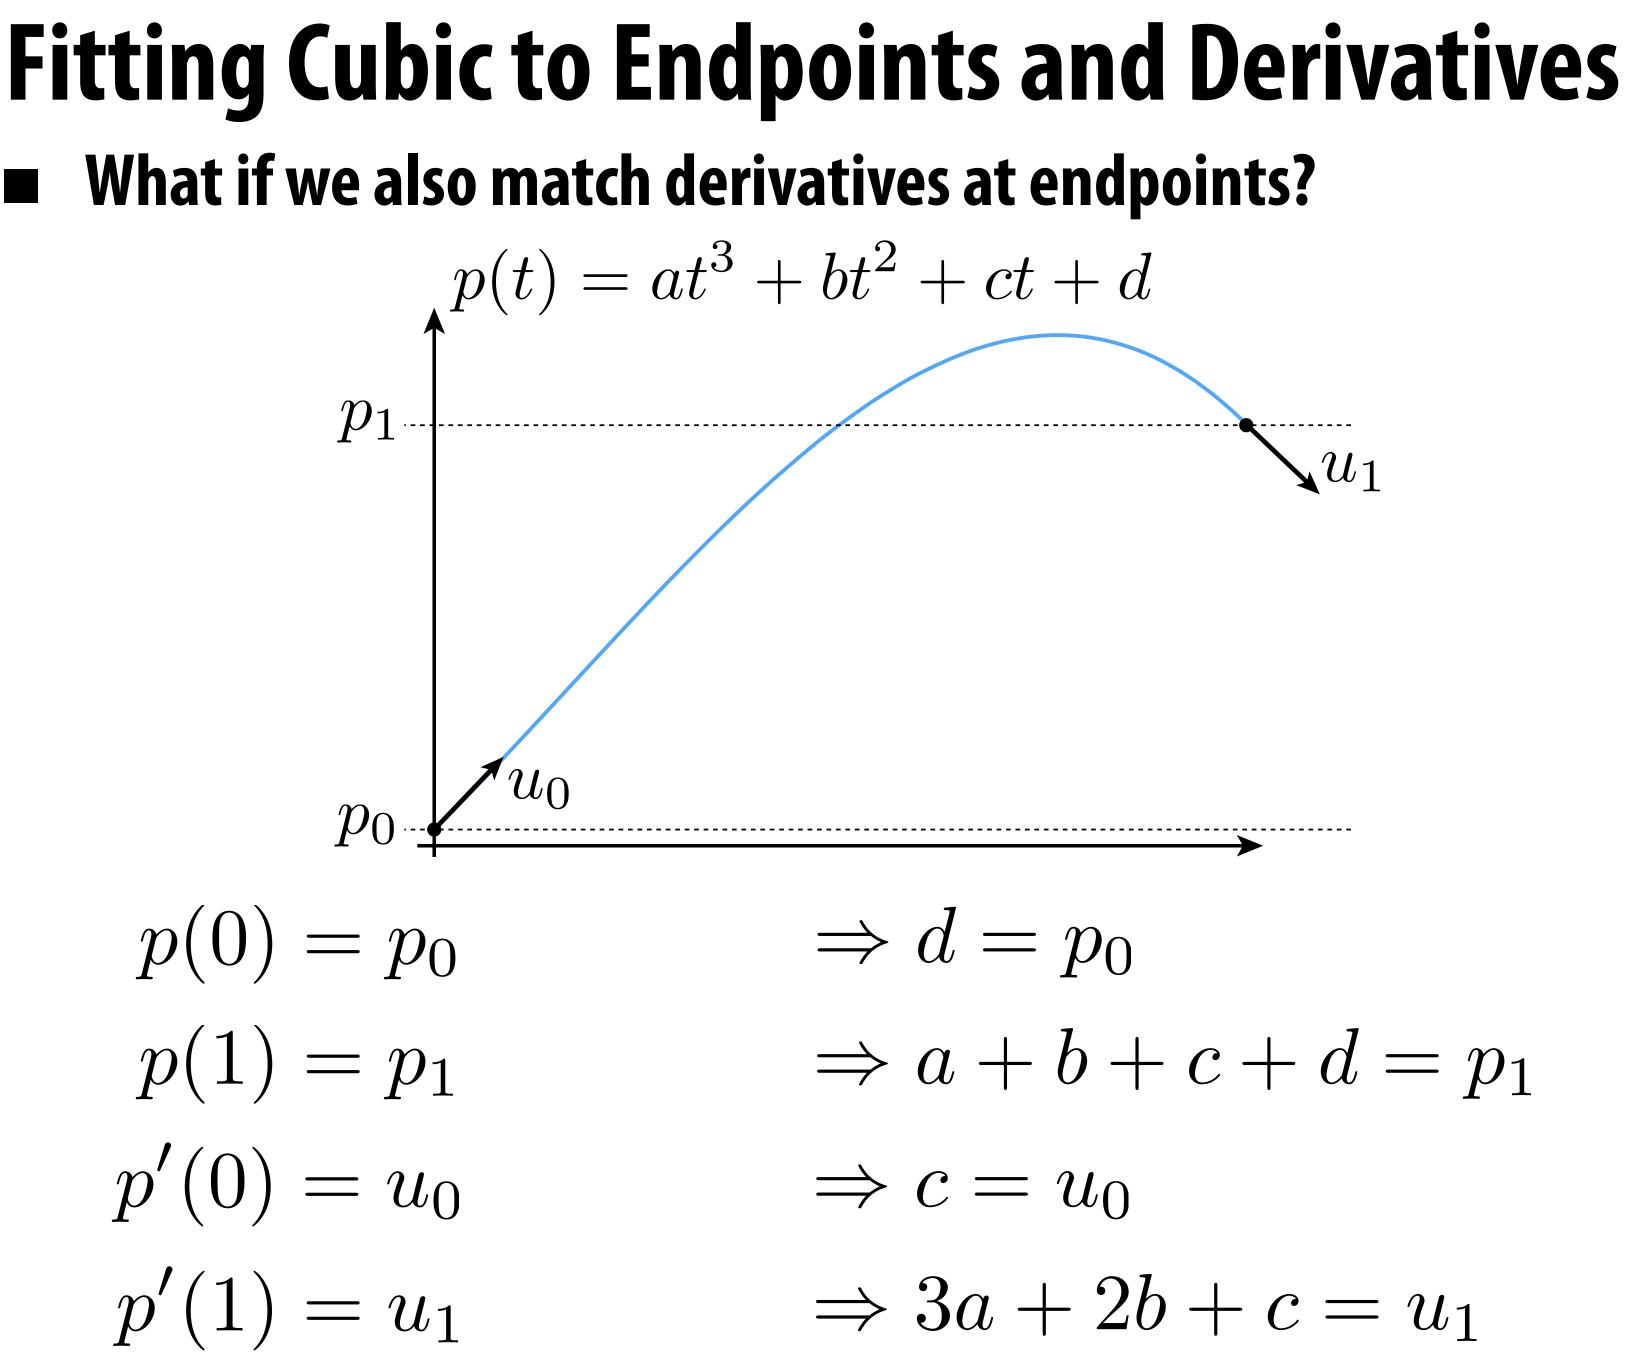

Cubic Polynomial - Degrees of Freedom

- Why are there so many different solutions?
- Cubic polynomial has four degrees of freedom (DOFs), namely four coefficients (a,b,c,d) that we can manipulate/control
 - **Only need two degrees of freedom to specify endpoints:**

$$p(t) = at^{3} + bt^{2} + ct + d$$
$$p(0) = p_{0} \qquad \Rightarrow d =$$
$$p(1) = p_{1} \qquad \Rightarrow a +$$

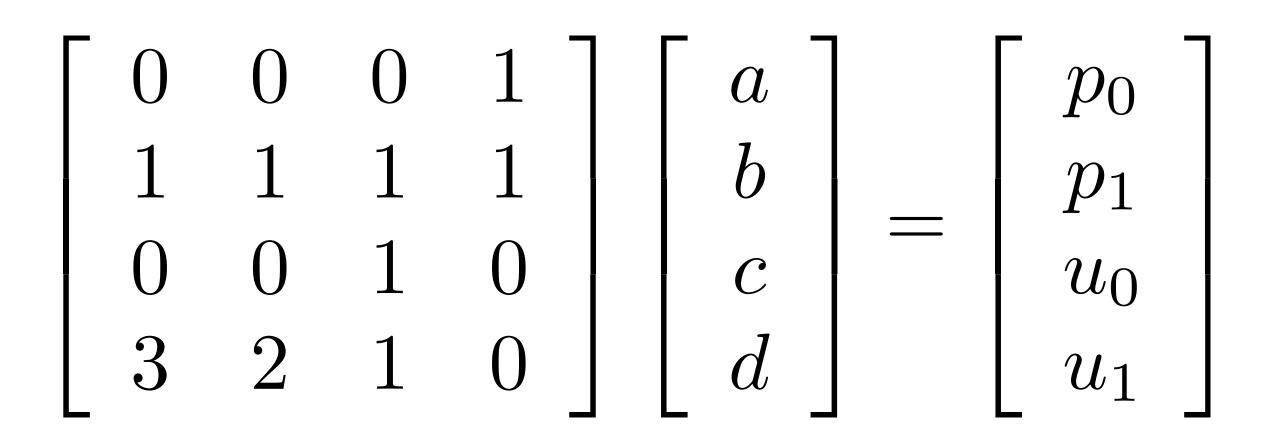

Overall, four unknowns but only two equations Not enough to uniquely determine the curve!

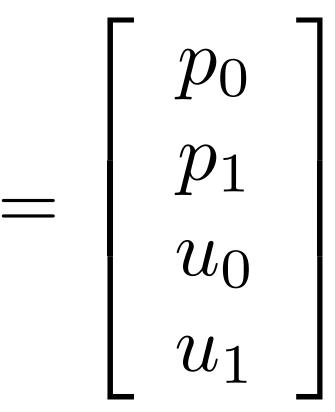

Splines as Linear Systems

- This time, we have four equations in four unknowns
- **Could also express as a matrix equation:**

- Often, this is the game we will play:
 - each condition on spline leads to a linear equality
 - hence, if we have m degrees of freedom, we need m (linearly independent!) conditions to determine spline

Natural Splines

- Now consider piecewise spline made of cubic polynomials p_i
- For each interval, want polynomial "piece" p_i to interpolate data (e.g., keyframes) at both endpoints:
 - $p_i(t_i) = f_i, \ p_i(t_{i+1}) = f_{i+1}, \ i = 0, \dots, n-1$
 - Want tangents to agree at endpoints ("C¹ continuity"):
 - $p'(t_{i+1}) = p'_{i+1}(t_{i+1}), \ i = 0, \dots, n-2$
- Also want curvature to agree at endpoints ("C² continuity"): $p''(t_{i+1}) = p''_{i+1}(t_{i+1}), \ i = 0, \dots, n-2$
 - How many equations do we have at this point?
 - 2n+(n-1)+(n-1) = 4n-2
- Pin down remaining DOFs by setting curvature to zero at endpoints (this is what makes the curve "natural")

Spline Desiderata

In general, what are some properties of a "good" spline?

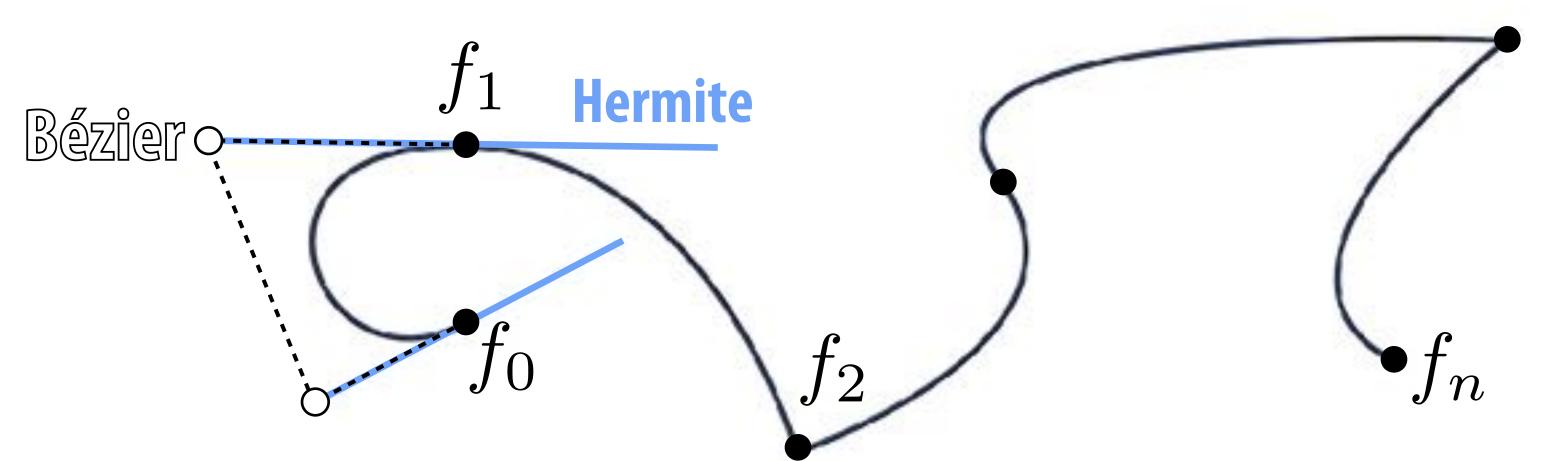

- INTERPOLATION: spline passes exactly through data points
- CONTINUITY: at least twice differentiable everywhere
- LOCALITY: moving one control point doesn't affect whole curve
- How does our natural spline do?
 - INTERPOLATION: yes, by construction
 - CONTINUITY: C² everywhere
 - LOCALITY: no, coefficients depend on global linear system
- Many other types of splines we can consider
- Spoiler: there is "no free lunch" with cubic splines (can't simultaneously get all three properties)

a "good" spline? rough data points e everywhere sn't affect whole curve

global linear system ider ic splines (can't

Review: Hermite/Bézier Splines

Discussed briefly in introduction to geometry Each cubic "piece" specified by endpoints and tangents:

- Equivalently: by four points (Bézier form); just take difference!
- Commonly used for 2D vector art (Illustrator, Inkscape, SVG, ...)
- **Can we get tangent continuity?**
- Sure: set both tangents to same value on both sides of knot!
 - **E.g.**, f_1 above, but not f_2

Properties of Hermite/Bézier Spline

- More precisely, want endpoints to interpolate data: $p_i(t_i) = f_i, \ p_i(t_{i+1}) = f_{i+1}, \ i = 0, \dots, n-1$
- Also want tangents to interpolate some given data: $p'_i(t_i) = u_i, \ p'(i)_{t_{i+1}} = u_{i+1}, \ i = 0, \dots, n-1$
- How is this different from our natural spline's tangent condition?
- There, tangents didn't have to match any prescribed value— they merely had to be the same. Here, they are given.
- How many conditions overall?

 $\square 2n + 2n = 4n$

- What properties does this curve have?
 - INTERPOLATION and LOCALITY, but not C² CONTINUITY

Catmull-Rom Splines

- Sometimes makes sense to specify tangents (e.g., illustration)
- **Often more convenient to just specify values**
- Catmull-Rom: specialization of Hermite spline, determined by values alone
 - **Basic idea: use difference of neighbors to define tangent** $u_i := \frac{f_{i+1} f_{i-1}}{t_{i+1} t_{i-1}}$
- All the same properties as any other Hermite spline (locality, etc.)
- Commonly used to interpolate motion in computer animation.

Many, many variants, but Catmull-Rom is usuallygood starting point

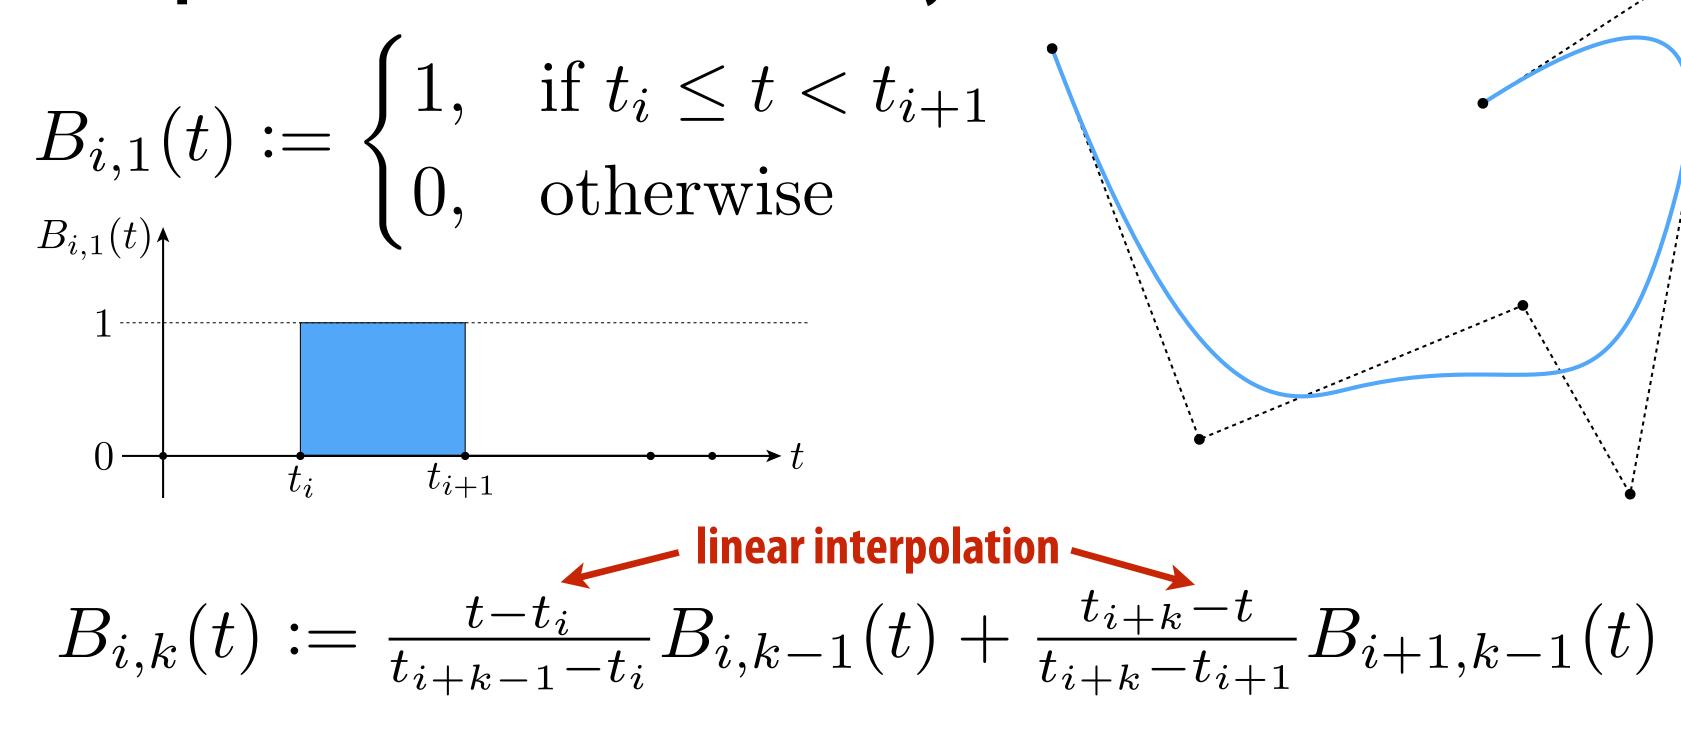

Spline Desiderata, Revisited

	INTERPOLATION	CONTINUITY	LOCALITY
natural	YES	YES	NO
Hermite	YES	NO	YES
???	NO	YES	YES

B-Splines

Get better continuity and local control by sacrificing interpolation **B-spline basis defined recursively:**

B-spline itself is then a linear combination of bases:

$$f(t) := \sum_{i} a_i E$$

Spline Desiderata, Revisited

	INTERPOLATION	CONTINUITY	LOCALITY
natural	YES	YES	NO
Hermite	YES	NO	YES
B-splines	NO	YES	YES

Ok, I get it: splines are great. But what exactly are we interpolating?

Simple example: camera path

- Animate position, direction, "up" direction of camera
 - each path is a function f(t) = (x(t), y(t), z(t))
 - each component (x,y,z) is a spline

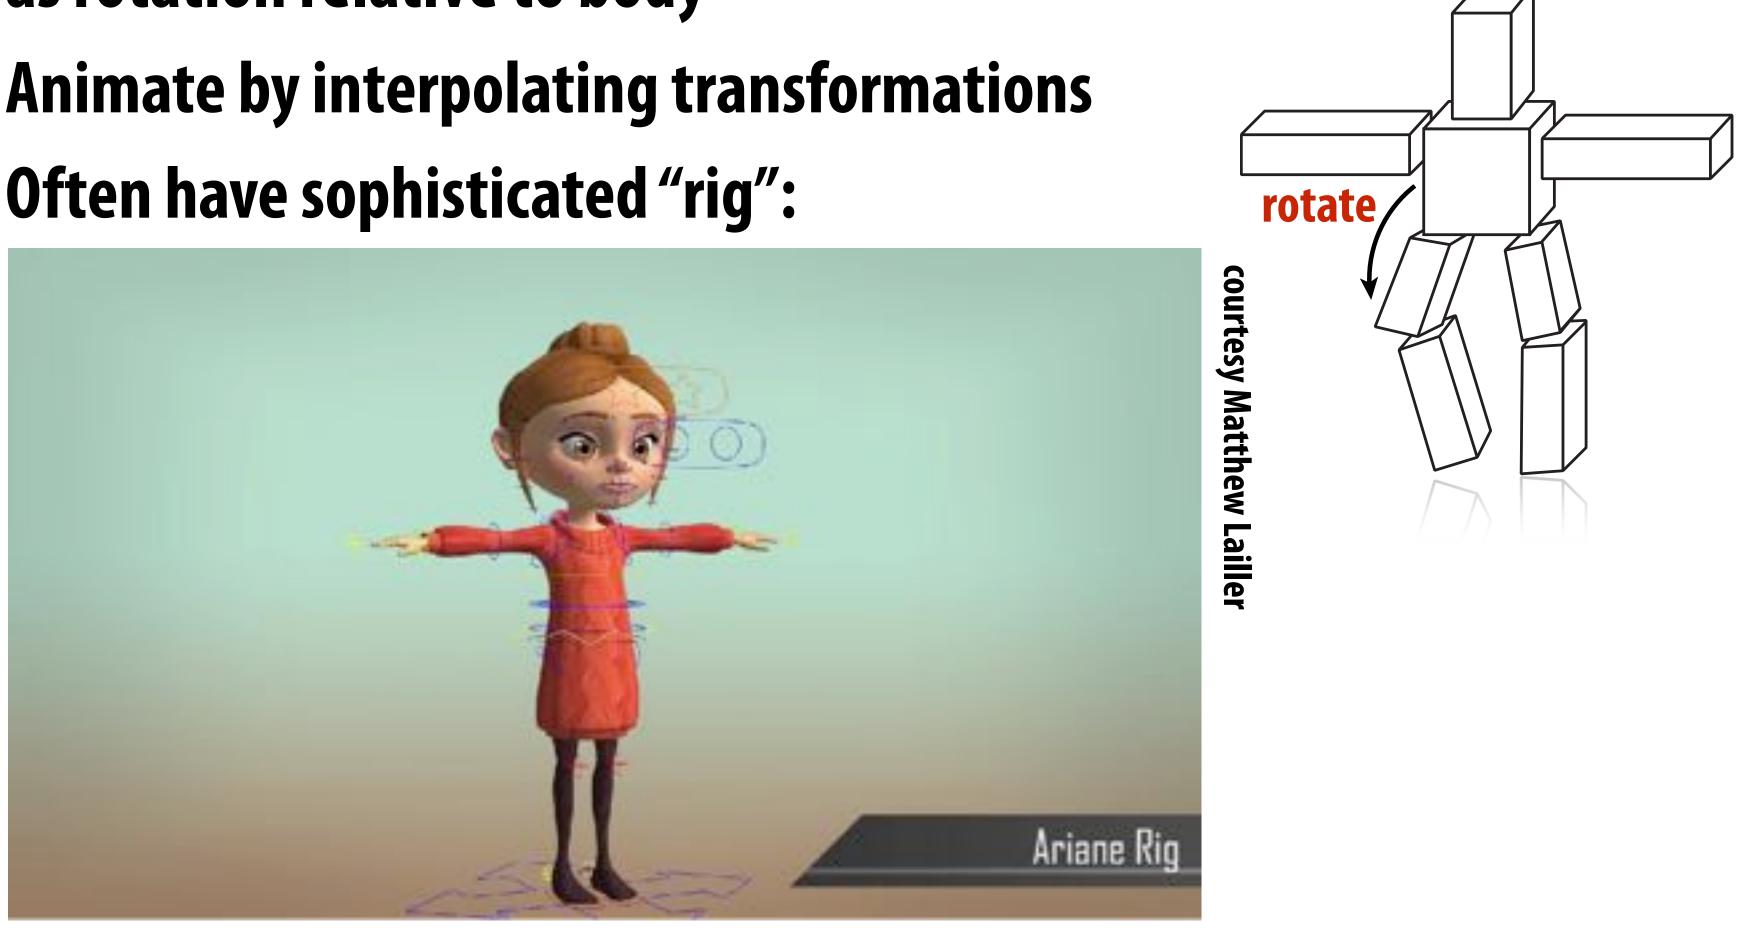

h on of camera t), z(t))

Zaha Hadid Architects—City of Dreams Hotel Towe

Character Animation

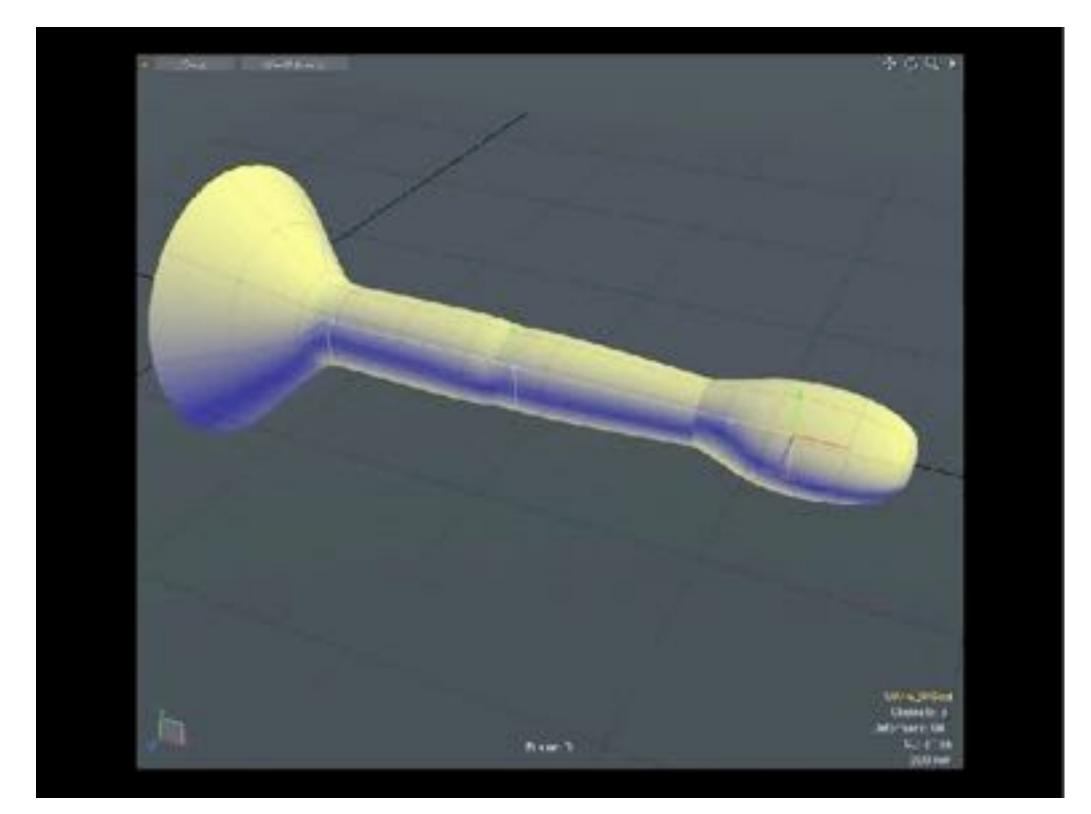

- Scene graph/kinematic chain: scene as tree of transformations
- E.g. in our "cube man," configuration of a leg might be expressed as rotation relative to body
- **Often have sophisticated "rig":**

Even w/ computer "tweening," a lot of work to animate!

Inverse Kinematics

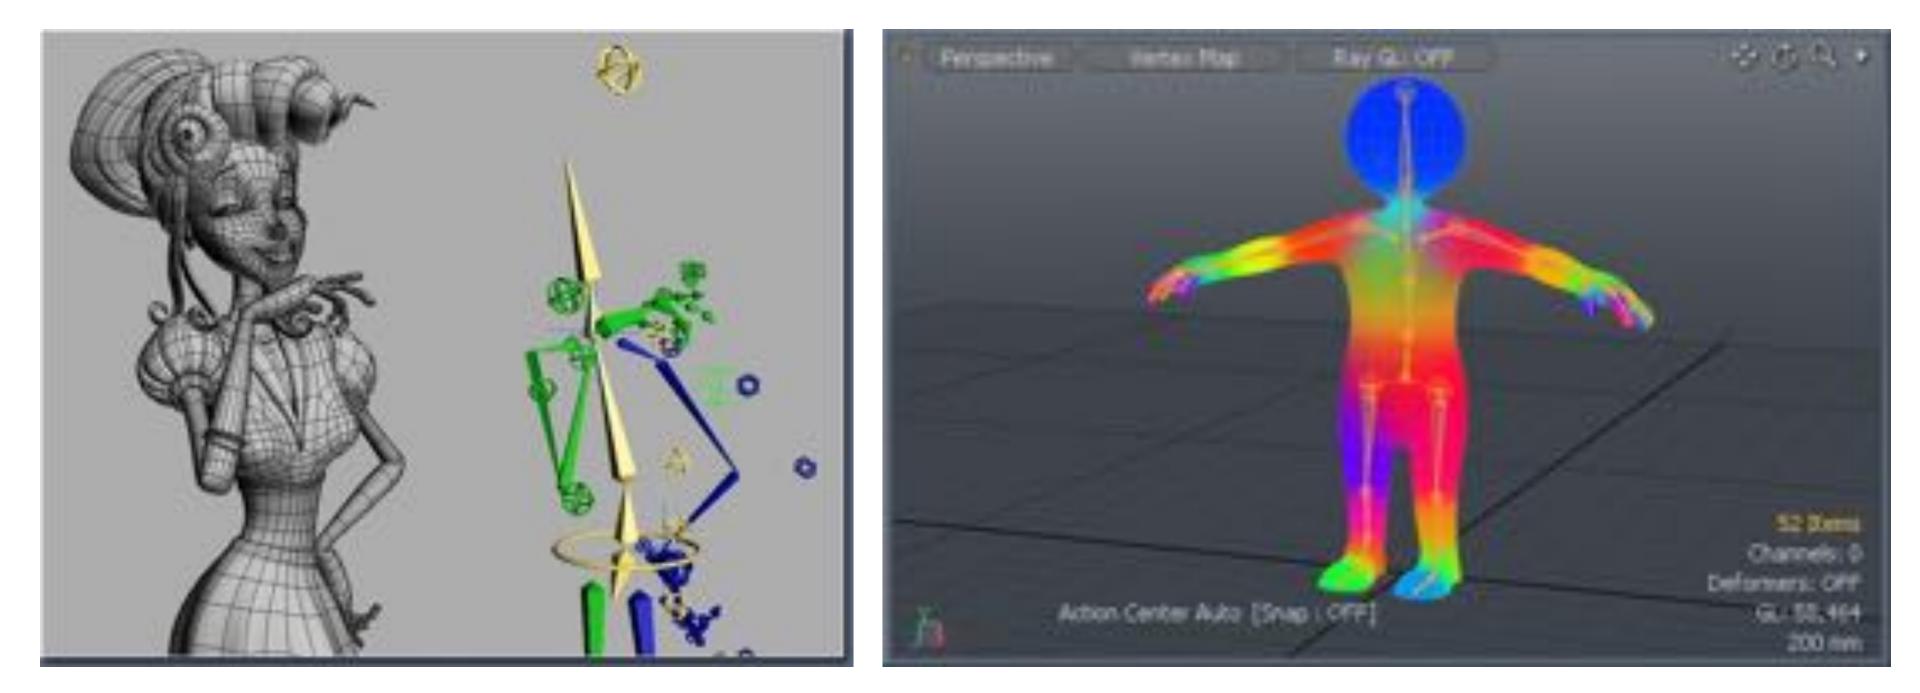

- Important technique in animation & robotics
- Rather than adjust individual transformations, set "goal" and use algorithm to come up with plausible motion:

Many algorithms—more to come in assignment 4

Skeletal Animation

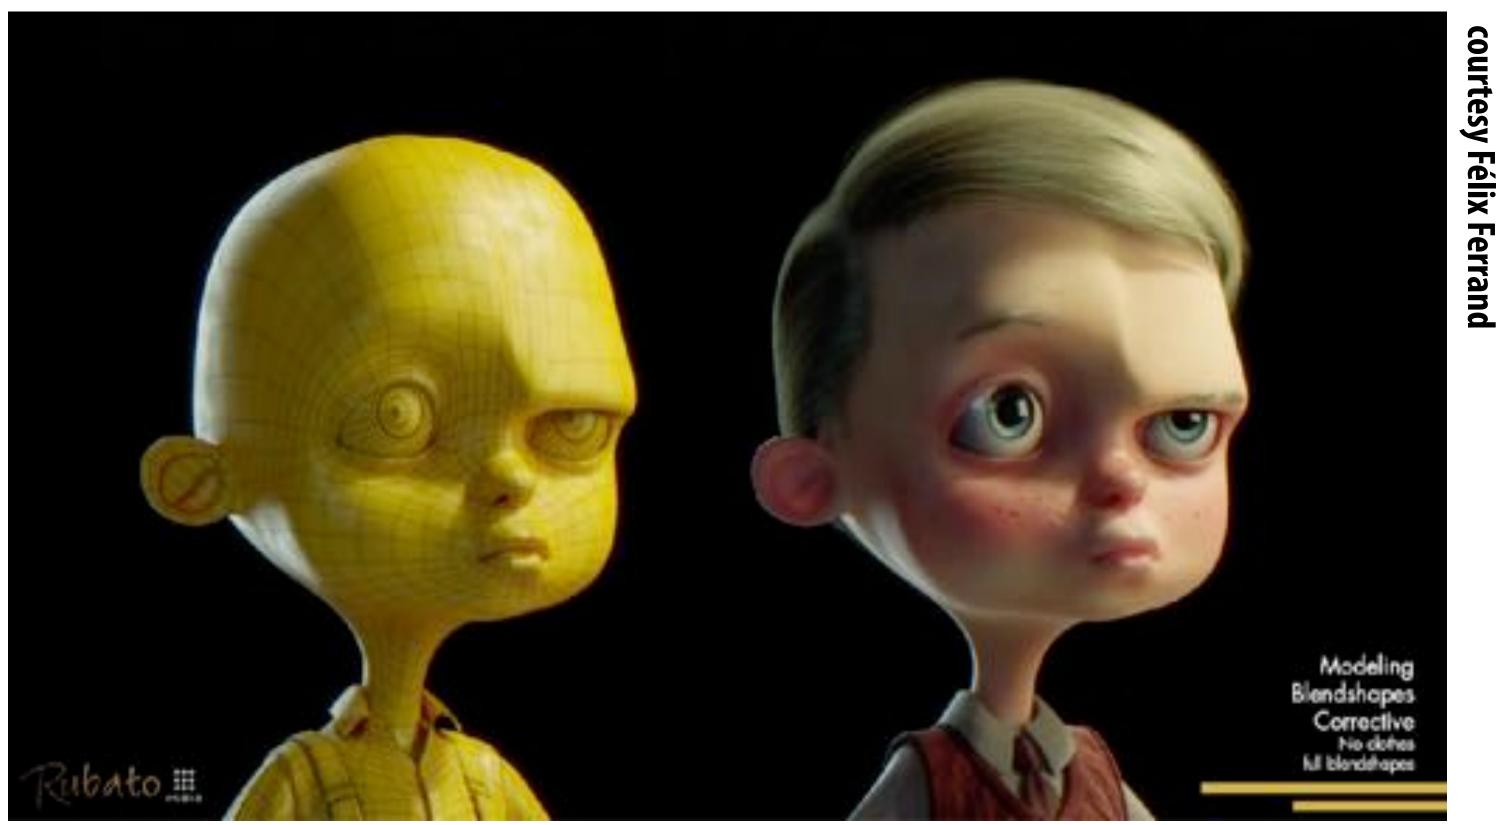

Previous characters looked a lot different from "cube man"! Often use "skeleton" to drive deformation of continuous surface Influence of each bone determined by, e.g., weighting function:

(Many, many other possibilities—still very active area of R&D)

Blend Shapes

- Instead of skeleton, interpolate directly between surfaces
- E.g., model a collection of facial expressions:

Simplest scheme: take linear combination of vertex positions Spline used to control choice of weights over time

Coming up next...

- Even with "computer-aided tweening," animating everything by hand takes a lot of work!
- Will see how data, physical simulation can help
