

# Geometric Queries

---

**Computer Graphics**  
**CMU 15-462/15-662**

# Geometric Queries—Motivation

# Last Time: Danger of Resampling

**Idea: after resampling, project each vertex onto original mesh**

# Closest Point Queries

- **Q: Given a point, in space (e.g., a new sample point), how do we find the closest point on a given surface?**
- **Q: Does implicit/explicit representation make this easier?**
- **Q: Does our halfedge data structure help?**
- **Q: What's the cost of the naïve algorithm?**
- **Q: How do we find the distance to a single triangle anyway?**
- **So many questions!**

# Many types of geometric queries

- Already identified need for “closest point” query
- Plenty of other things we might like to know:

- Do two triangles intersect?
- Are we inside or outside an object?
- Does one object contain another?
- ...

- Data structures we've seen so far not really designed for this...
- Need some new ideas!
- TODAY: come up with simple (read: slow) algorithms.
- NEXT TIME: intelligent ways to accelerate geometric queries.

# Warm up: closest point on point

- Goal is to find the point on a mesh closest to a given point.
- Much simpler question: given a query point  $(p_1, p_2)$ , how do we find the closest point on the point  $(a_1, a_2)$ ?

**Bonus question: what's the distance?**

# Slightly harder: closest point on line

- Now suppose I have a line  $\mathbf{N}^T \mathbf{x} = c$ , where  $\mathbf{N}$  is the unit normal
- How do I find the point closest to my query point  $\mathbf{p}$ ?

# Harder: closest point on line segment

- **Two cases: endpoint or interior**
- **Already have basic components:**
  - **point-to-point**
  - **point-to-line**
- **Algorithm?**
  - **find closest point on line**
  - **check if it's between endpoints**
  - **if not, take closest endpoint**
- **How do we know if it's between endpoints?**
  - **write closest point on line as  $a+t(b-a)$**
  - **if  $t$  is between 0 and 1, it's inside the segment!**

# Even harder: closest point on triangle

- What are all the possibilities for the closest point?
- Almost just minimum distance to three segments:

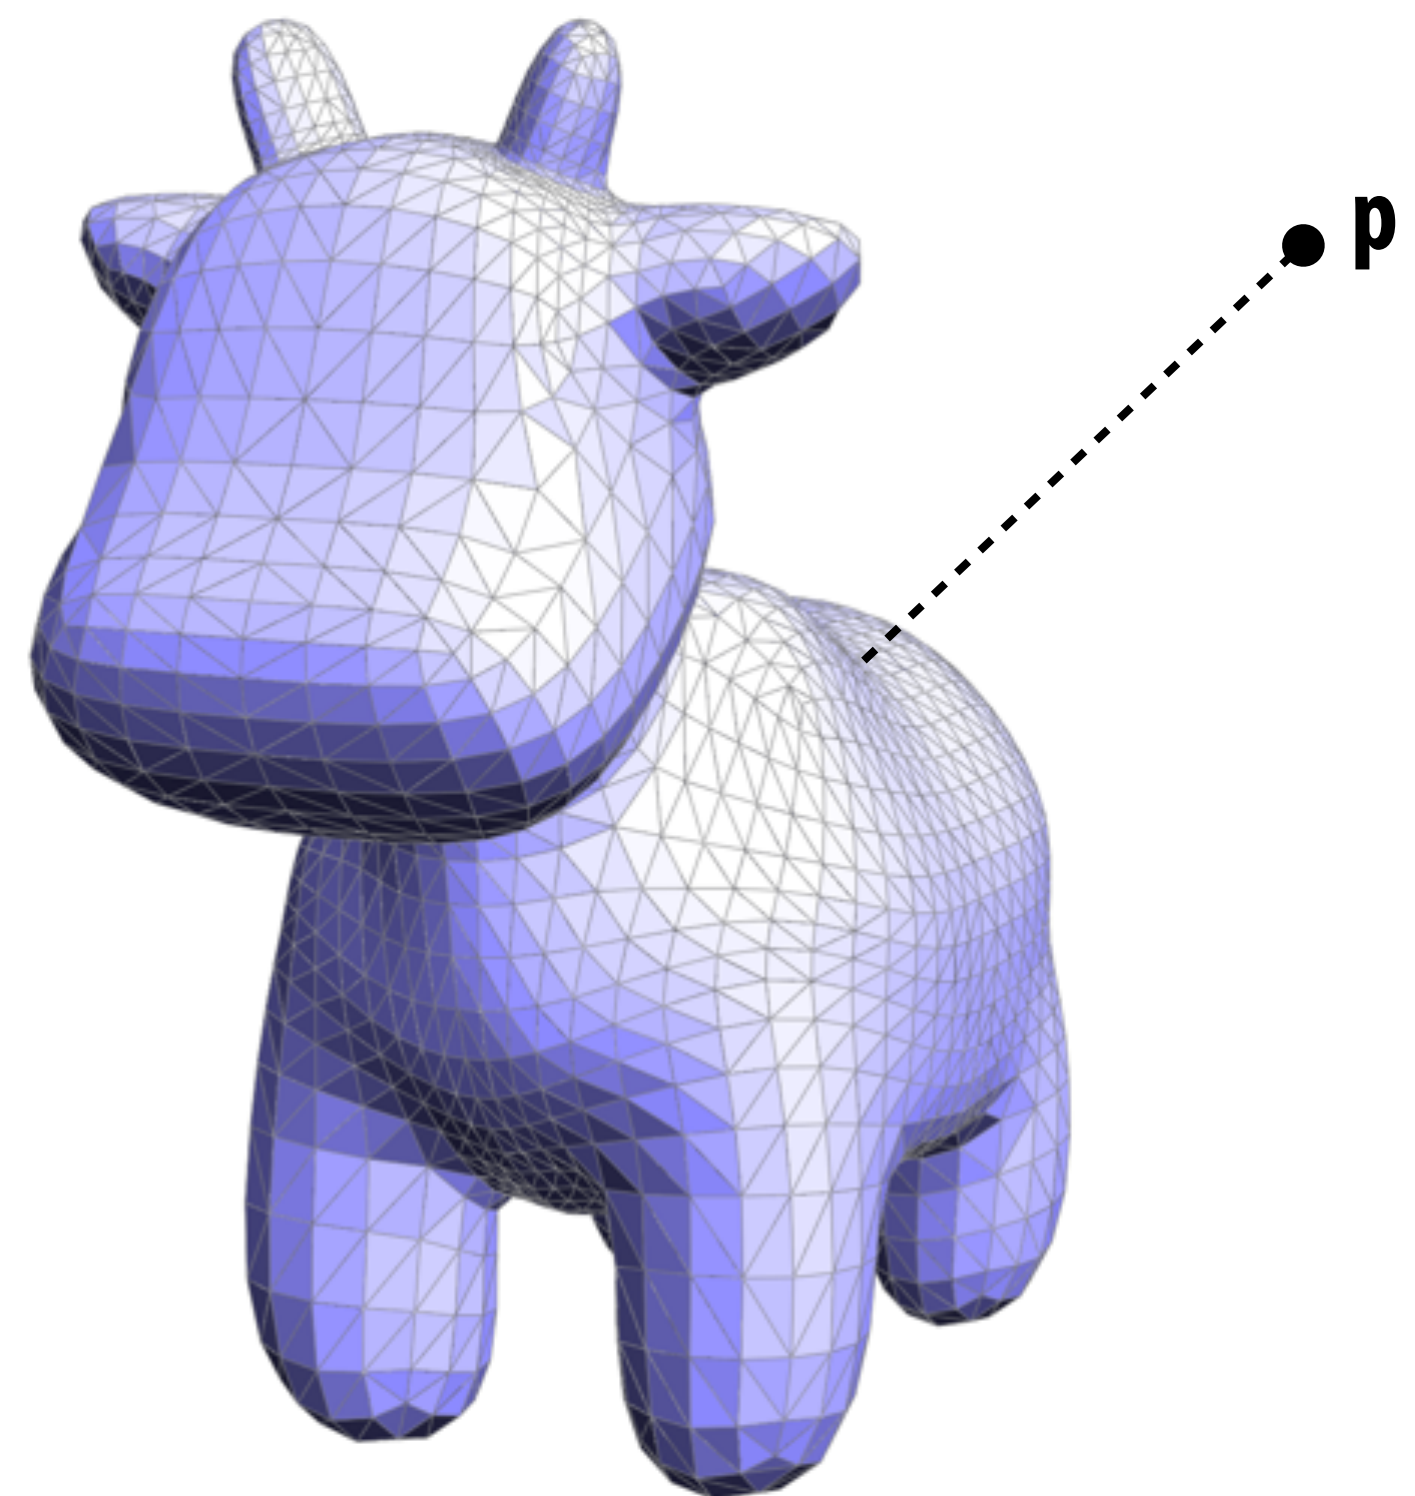

**Q: What about a point inside the triangle?**

# Closest point on triangle in 3D

- Not so different from 2D case
- Algorithm?
  - project onto plane of triangle
  - use half-space tests to classify point (vs. half plane)
  - if inside the triangle, we're done!
  - otherwise, find closest point on associated vertex or edge
- By the way, how do we find closest point on plane?
- Same expression as closest point on a line!
- E.g.,  $p + (c - N^T p) N$

# Closest point on triangle mesh in 3D?

- **Conceptually easy:**
  - loop over all triangles
  - compute closest point to current triangle
  - keep globally closest point
- **Q: What's the cost?**
- **What if we have billions of faces?**
- **NEXT TIME: Better data structures!**

# Closest point to implicit surface?

- If we change our representation of geometry, algorithms can change completely
- E.g., how might we compute the closest point on an implicit surface described via its distance function?
- One idea:
  - start at the query point
  - compute gradient of distance (using, e.g., finite differences)
  - take a little step (decrease distance)
  - repeat until we're at the surface (zero distance)
- Better yet: just store closest point for each grid cell! (speed/memory trade off)

# Different query: ray-mesh intersection

- A “ray” is an oriented line starting at a point
- Think about a ray of light traveling from the sun
- Want to know where a ray pierces a surface
- Why?
  - **GEOMETRY**: inside-outside test
  - **RENDERING**: visibility, ray tracing
  - **ANIMATION**: collision detection
- Might pierce surface in many places!

# Ray equation

- Can express ray as

$$\mathbf{r}(t) = \mathbf{o} + t\mathbf{d}$$

point along ray

origin

unit direction

"time"

# Intersecting a ray with an implicit surface

- Recall implicit surfaces: all points  $\mathbf{x}$  such that  $f(\mathbf{x}) = 0$
- Q: How do we find points where a ray pierces this surface?
- Well, we know all points along the ray:  $\mathbf{r}(t) = \mathbf{o} + t\mathbf{d}$
- Idea: replace “ $\mathbf{x}$ ” with “ $\mathbf{r}$ ” in 1st equation, and solve for  $t$
- Example: unit sphere

$$f(\mathbf{x}) = |\mathbf{x}|^2 - 1$$

$$\Rightarrow f(\mathbf{r}(t)) = |\mathbf{o} + t\mathbf{d}|^2 - 1$$

$$\underbrace{|\mathbf{d}|^2}_{a} t^2 + \underbrace{2(\mathbf{o} \cdot \mathbf{d})}_{b} t + \underbrace{|\mathbf{o}|^2 - 1}_{c} = 0$$

$$t = \boxed{-\mathbf{o} \cdot \mathbf{d} \pm \sqrt{(\mathbf{o} \cdot \mathbf{d})^2 - |\mathbf{o}|^2 + 1}}$$

quadratic formula:

$$t = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

**Why two solutions?**

# Ray-plane intersection

- Suppose we have a plane  $\mathbf{N}^T \mathbf{x} = c$

- $\mathbf{N}$  - unit normal

- $c$  - offset

- How do we find intersection with ray  $\mathbf{r}(t) = \mathbf{o} + t\mathbf{d}$ ?

- Key idea: again, replace the point  $\mathbf{x}$  with the ray equation  $t$ :

$$\mathbf{N}^T \mathbf{r}(t) = c$$

- Now solve for  $t$ :

$$\mathbf{N}^T (\mathbf{o} + t\mathbf{d}) = c \quad \Rightarrow \quad t = \frac{c - \mathbf{N}^T \mathbf{o}}{\mathbf{N}^T \mathbf{d}}$$

- And plug  $t$  back into ray equation:

$$\mathbf{r}(t) = \mathbf{o} + \frac{c - \mathbf{N}^T \mathbf{o}}{\mathbf{N}^T \mathbf{d}} \mathbf{d}$$

# Ray-triangle intersection

- Triangle is in a plane...
- Not much more to say!
  - Compute ray-plane intersection
  - Q: What do we do now?
  - A: Why not compute barycentric coordinates of hit point?
  - If barycentric coordinates are all positive, point in triangle
- Actually, a lot more to say... if you care about performance!

optimized SIMD ray-triangle intersection method evaluated on GPU for path-tracing

# Why care about performance?

**Intel Embree**

**NVIDIA OptiX**

# Why care about performance?

**“Brigade 3” real time path tracing demo**

# One more query: mesh-mesh intersection

- **GEOMETRY:** How do we know if a mesh intersects itself?
- **ANIMATION:** How do we know if a collision occurred?

# Warm up: point-point intersection

- **Q: How do we know if  $p$  intersects  $a$ ?**
- **A: ...check if they're the same point!**

$(p_1, p_2)$   
●

●  $(a_1, a_2)$

**Sadly, life is not always so easy.**

# Slightly harder: point-line intersection

- Q: How do we know if a point intersects a given line?
- A: ...plug it into the line equation!

p  
●

$$N^T x = c$$

**I promise, life isn't always so easy.**

# Finally interesting: line-line intersection

- Two lines:  $ax=b$  and  $cx=d$
- Q: How do we find the intersection?
- A: See if there is a simultaneous solution

- Leads to linear system: 
$$\begin{bmatrix} a_1 & a_2 \\ c_1 & c_2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} b \\ d \end{bmatrix}$$

# Degenerate line-line intersection?

- **What if lines are almost parallel?**
- **Small change in normal can lead to big change in intersection!**
- **Instability very common, very important with geometric predicates. Demands special care (e.g., analysis of matrix).**

# Triangle-Triangle Intersection?

- Lots of ways to do it

- Basic idea:

- Q: Any ideas?

- One way: reduce to edge-triangle intersection

- Check if each line passes through plane

- Then do interval test

- What if triangle is moving?

- Important case for animation

- Can think of triangles as prisms in time

- Turns dynamic problem ( $nD + \text{time}$ ) into purely geometric problem in  $(n+1)$ -dimensions

# Up Next: Spatial Acceleration Data Structures

- Testing every element is slow!
- E.g., linearly scanning through a list vs. binary search
- Can apply this same kind of thinking to geometric queries
